MARKET SURVEY STATISTICAL APPENDIX - RECORD 001

Helioscope Robotics, Inc. - diligence file reference MARKET_APPENDICES-001

1. Research question and scope

Kessler Ward Research publishes this volume on liquidation preference and participation alongside the term survey covering financings from 1 July 2023 to 31 March 2026. It asks how often a preference above one times invested capital is taken, and on what participation terms, over 1,250 admitted observations of which 1,162 disclose preference structure. The screen admitting them reads: priced preferred financings whose charter or purchase agreement was obtained.

On the methodology, the population underlying liquidation preference and participation was fixed before any preference structure figure was computed, because the same company appearing in two financings contributes two observations only where both fall inside the measurement window. For 1.0x participating, uncapped the register yields 241 observations, 20.7% of the 1,162 that disclose preference structure, and the adjacent row for above 1.0x non-participating is computed identically. The working papers add that geographic coverage for preference structure is strongest in Nordics and is reported as thin elsewhere.

As recorded in the decision log, any engagement's own transaction is excluded from the liquidation preference and participation comparison population, so an instrument obtained after the edition closed is held for the next edition rather than folded into a published table. 1.0x participating, uncapped accounts for 241 of the 1,162 disclosing observations, 20.7% of them, and 1.0x participating, capped is tabulated on that identical base rather than on the wider population. In the same connection, geographic coverage for preference structure is strongest in US West and is reported as thin elsewhere.

Read against the prior edition, trend commentary on liquidation preference and participation separates a movement in terms from a movement in the sample, and a change since the prior edition is attributed to new observations, to a recode, or to a correction, and never left unexplained. The preference structure partition puts 276 observations under 1.0x participating, capped and reports 23.8% on a denominator of 1,162; 1.0x participating, uncapped is drawn from the same base so the two shares may be added. It follows that for the 2025 Q1 sub-period the preference structure count is published with its own denominator rather than folded into the annual figure.

For the avoidance of doubt, quartiles rather than means are published for liquidation preference and participation, since the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. above 1.0x participating accounts for 301 of the 1,162 disclosing observations, 25.9% of them, and above 1.0x non-participating is tabulated on that identical base rather than on the wider population. On the same evidence, only where a filed instrument established it is the $20m to $50m revenue band applied to preference structure.

Register 1.1 - observations screened for the liquidation preference and participation population (1,250 admitted)

1. Research question and scope - part 2 of 3

Because the 1. Research question and scope does not fit one page, its remainder is set out below under the same references. The sequence is unbroken either side of it.

Definitions given once for the 1. Research question and scope are relied on again rather than restated, the compilation basis being identical. Nothing is restated from the earlier part.

Register 1.1 - observations screened for the liquidation preference and participation population (1,250 admitted) (continued, part 2 of 3)

1. Research question and scope - part 3 of 3

For length, the 1. Research question and scope is presented in 3 parts; this is the next of them, and the rows continue the same sequence. The parts are to be read together.

No basis of compilation changes at this break; whatever the 1. Research question and scope recorded about scope and method at its head continues to apply. Nothing is restated from the earlier part.

Register 1.1 - observations screened for the liquidation preference and participation population (1,250 admitted) (continued, part 3 of 3)

2. Population definition and screen

Put in terms of denominators, the population underlying liquidation preference and participation was fixed before any preference structure figure was computed, because the measurement window is fixed at the edition date, and observations are not backfilled once the edition has been published. Applied to 1.0x non-participating, that gives 153 observations against a usable denominator of 1,162, or 13.2%; the comparison against above 1.0x participating rests on the same denominator, so the variants remain additive within the preference structure partition. The reviewer also recorded that within Series B the preference structure partition is reported separately, because its disclosure rate differs from the population rate.

Turning to the register, an observation contributes to liquidation preference and participation once only, and an instrument obtained after the edition closed is held for the next edition rather than folded into a published table. The share reported for 1.0x participating, uncapped is 20.7%, from 241 observations in a denominator of 1,162, and 1.0x participating, uncapped is measured on that denominator so neither absorbs the other's cases. The reviewer also recorded that within Series A the preference structure partition is reported separately, because its disclosure rate differs from the population rate.

Before any tabulation, an observation contributes to liquidation preference and participation once only, and no figure here rests on a single unverified secondary source without that being visible in the source tier column. above 1.0x non-participating accounts for 191 of the 1,162 disclosing observations, 16.4% of them, and 1.0x non-participating is tabulated on that identical base rather than on the wider population. One consequence is that where industrial robotics observations are thin, the preference structure share is reported with its count rather than as a percentage alone.

For the avoidance of doubt, coding practice for preference structure departs from loose market usage, in that the same company appearing in two financings contributes two observations only where both fall inside the measurement window. Reading the preference structure partition row by row, above 1.0x non-participating carries 191 observations and

16.4%, measured against 1,162; the 1.0x participating, uncapped row is additive with it. The reviewer also recorded that instruments bearing on preference structure came from 113 contributing firms for this edition.

3. Source hierarchy and admissibility

On the methodology, research design for preference structure begins from the population rather than the tabulation, because a change since the prior edition is attributed to new observations, to a recode, or to a correction, and never left unexplained. 153 observations were coded 1.0x non-participating, giving 13.2% against the 1,162 disclosing this field; above 1.0x participating is reported beside it on the same base for comparability. A related point: for the 2023 Q2 sub-period the preference structure count is published with its own denominator rather than folded into the annual figure.

As between the variants, sensitivity analysis reruns each preference structure share under alternative treatments, and no figure here rests on a single unverified secondary source without that being visible in the source tier column. The preference structure partition puts 241 observations under 1.0x participating, uncapped and reports 20.7% on a denominator of 1,162; 1.0x non-participating is drawn from the same base so the two shares may be added. Against that background, for the 2026 Q2 sub-period the preference structure count is published with its own denominator rather than folded into the annual figure.

As between the variants, field-level disclosure rates for preference structure are published beside every share, so the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. Applied to 1.0x participating, capped, that gives 276 observations against a usable denominator of 1,162, or 23.8%; the comparison against 1.0x participating, capped rests on the same denominator, so the variants remain additive within the preference structure partition. In the same connection, geographic coverage for preference structure is strongest in Nordics and is reported as thin elsewhere.

In the publisher's own terms, any engagement's own transaction is excluded from the liquidation preference and participation comparison population, so no figure here rests on a single unverified secondary source without that being visible in the source tier column. The preference structure partition puts 301 observations under above 1.0x participating and reports 25.9% on a denominator of 1,162; above 1.0x participating is drawn from the same base so the two shares may be added. It bears noting that within Series B the preference structure partition is reported separately, because its disclosure rate differs from the population rate.

4. Coding rules for ambiguous instruments

At the level of the individual instrument, field-level disclosure rates for preference structure are published beside every share, so the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. Counting only disclosing observations, 1.0x participating, uncapped reaches 20.7%, being 241 of 1,162; the figure for above 1.0x non-participating shares that denominator and no observation is counted twice between them. The composition tables show that instruments bearing on preference structure came from 124 contributing firms for this edition.

In the analyst's working notes, because instruments disclose preference structure unevenly, the count admitted under the screen is stated in the register caption and is never adjusted afterwards to improve a result. For 1.0x non-participating the register yields 153 observations, 13.2% of the 1,162 that disclose preference structure, and the adjacent row for above 1.0x non-participating is computed identically. It bears noting that instruments bearing on preference structure came from 119 contributing firms for this edition.

Where the sample is thin, source tiering governs what may be asserted about preference structure, so the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. Counting only disclosing observations, 1.0x participating, uncapped reaches 20.7%, being 241 of 1,162; the figure for 1.0x participating, capped shares that denominator and no observation is counted twice between them. On the same evidence, only where a filed instrument established it is the over $50m revenue band applied to preference structure.

By way of scope, where liquidation preference and participation is concerned the screen admits an observation only when the published share and the composition-adjusted share appear side by side, and where they diverge the attribution column says which. Reading the preference structure partition row by row, above 1.0x participating carries 301 observations and 25.9%, measured against 1,162; the 1.0x participating, uncapped row is additive with it. By the same

token, where machine vision observations are thin, the preference structure share is reported with its count rather than as a percentage alone.

Table 1.2 - preference structure frequency on a usable denominator of 1,162

Preference structure	Observations	Usable denominator	Share of usable	Prior edition share	Movement
1.0x non-participating	153	1,162	13.2%	9.4%	+3.8 pp
1.0x participating, capped	276	1,162	23.8%	27.4%	-3.6 pp
1.0x participating, uncapped	241	1,162	20.7%	7.2%	+13.5 pp
above 1.0x non-participating	191	1,162	16.4%	31.5%	-15.1 pp
above 1.0x participating	301	1,162	25.9%	24.5%	+1.4 pp
not disclosed (excluded from denominator)	88	1,250	7.0%	-	-

5. Disclosure treatment and denominators

Silence on preference structure affects 88 of the 1,250 observations, so the usable denominator is 1,162, a disclosure rate of 93.0%. No table in this volume divides by 1,250. Doing so would credit the silent observations with an absence of preference structure that no instrument supports.

With the register open alongside, two provisions in tension over preference structure are resolved by the coding rule rather than by judgement, and the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. For above 1.0x participating the register yields 301 observations, 25.9% of the 1,162 that disclose preference structure, and the adjacent row for above 1.0x participating is computed identically. The reviewer also recorded that instruments bearing on preference structure came from 118 contributing firms for this edition.

Judged by the disclosure rate, contributing firms supply instruments bearing on preference structure rather than summaries of them, and the count admitted under the screen is stated in the register caption and is never adjusted afterwards to improve a result. The preference structure partition puts 241 observations under 1.0x participating, uncapped and reports 20.7% on a denominator of 1,162; 1.0x non-participating is drawn from the same base so the two shares may be added. It follows that observations sourced from a counsel-confirmed summary are admitted for preference structure but marked so in the source tier column.

Once the exclusions are applied, where liquidation preference and participation is concerned the screen admits an observation only when a term recorded as undisclosed is withheld from the denominator, the only treatment consistent with the disclosure rate printed beside it. Applied to above 1.0x participating, that gives 301 observations against a usable denominator of 1,162, or 25.9%; the comparison against above 1.0x non-participating rests on the same denominator, so the variants remain additive within the preference structure partition. Worth stating plainly: the screen for this volume reads: priced preferred financings whose charter or purchase agreement was obtained, measured over the window to 31 March 2026.

For a reader auditing the screen, research design for preference structure begins from the population rather than the tabulation, because the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. Counting only disclosing observations, 1.0x participating, uncapped reaches 20.7%, being 241 of 1,162; the figure for 1.0x non-participating shares that denominator and no observation is counted twice between them. A related point: where fleet telematics observations are thin, the preference structure share is reported with its count rather than as a percentage alone.

6. Reported distributions

Before any tabulation, because instruments disclose preference structure unevenly, the same company appearing in two financings contributes two observations only where both fall inside the measurement window. The preference structure partition puts 276 observations under 1.0x participating, capped and reports 23.8% on a denominator of 1,162;

1.0x participating, capped is drawn from the same base so the two shares may be added. By the same token, instruments bearing on preference structure came from 125 contributing firms for this edition.

In the analyst's working notes, this volume treats liquidation preference and participation as its measured field, and the measurement window is fixed at the edition date, and observations are not backfilled once the edition has been published. 276 observations were coded 1.0x participating, capped, giving 23.8% against the 1,162 disclosing this field; 1.0x participating, capped is reported beside it on the same base for comparability. Worth stating plainly: the screen for this volume reads: priced preferred financings whose charter or purchase agreement was obtained, measured over the window to 31 March 2026.

Considered field by field, an analyst recoding a preference structure observation must record the alternative, because an observation excluded on review keeps its exclusion reason in the register, so the screen can be audited rather than trusted. For above 1.0x non-participating the register yields 191 observations, 16.4% of the 1,162 that disclose preference structure, and the adjacent row for 1.0x non-participating is computed identically. The register records that observations sourced from a executed instrument are admitted for preference structure but marked so in the source tier column.

Once the exclusions are applied, segment cuts of preference structure describe the observed sample only, and an observation excluded on review keeps its exclusion reason in the register, so the screen can be audited rather than trusted. For 1.0x non-participating the register yields 153 observations, 13.2% of the 1,162 that disclose preference structure, and the adjacent row for above 1.0x participating is computed identically. A qualification applies here: for the 2025 Q4 sub-period the preference structure count is published with its own denominator rather than folded into the annual figure.

6. Reported distributions - part 2 of 3

Set out next is the balance of the 6. Reported distributions, in the sequence in which the rows were originally compiled. Pagination alone determines where it falls.

Column definitions stated with the first part of the 6. Reported distributions govern the whole of it, and any qualification recorded there is carried forward here.

Register 1.1 - observations screened for the liquidation preference and participation population (1,250 admitted) (continued, part 2 of 3)

6. Reported distributions - part 3 of 3

Rows of the 6. Reported distributions resume here, numbered on from the part immediately preceding, so a reference cited once resolves in only one place. The sequence is unbroken either side of it.

Definitions given once for the 6. Reported distributions are relied on again rather than restated, the compilation basis being identical. No row is omitted at the join.

Register 1.1 - observations screened for the liquidation preference and participation population (1,250 admitted) (continued, part 3 of 3)

7. Segment cuts

In the analyst's working notes, two provisions in tension over preference structure are resolved by the coding rule rather than by judgement, and the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. The share reported for 1.0x non-participating is 13.2%, from 153 observations in a denominator of 1,162, and 1.0x participating, uncapped is measured on that denominator so neither absorbs the other's cases. Equally, within Growth the preference structure partition is reported separately, because its disclosure rate differs from the population rate.

Considered field by field, this volume treats liquidation preference and participation as its measured field, and the published share and the composition-adjusted share appear side by side, and where they diverge the attribution column says which. For above 1.0x participating the register yields 301 observations, 25.9% of the 1,162 that disclose preference structure, and the adjacent row for 1.0x participating, capped is computed identically. The working papers add that instruments bearing on preference structure came from 112 contributing firms for this edition.

Measured over the whole window, outliers in the liquidation preference and participation tables are retained and documented rather than trimmed, which means the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. Counting only disclosing observations, 1.0x non-participating reaches 13.2%, being 153 of 1,162; the figure for 1.0x participating, capped shares that denominator and no observation is counted twice between them. The reviewer also recorded that the screen for this volume reads: priced preferred financings whose charter or purchase agreement was obtained, measured over the window to 31 March 2026.

Before any tabulation, this volume treats liquidation preference and participation as its measured field, and the published share and the composition-adjusted share appear side by side, and where they diverge the attribution column says which. 276 observations were coded 1.0x participating, capped, giving 23.8% against the 1,162 disclosing this field; above 1.0x non-participating is reported beside it on the same base for comparability. Worth stating plainly: the screen for this volume reads: priced preferred financings whose charter or purchase agreement was obtained, measured over the window to 31 March 2026.

Table 1.9 - movement in preference structure against the prior edition, by cause

Preference structure movement	Prior edition	This edition	Underlying change	Attributed cause
1.0x non-participating	20.2%	53.1%	65 new observations	recode of two observations
1.0x participating, capped	63.3%	22.9%	98 new observations	correction to a prior edition
1.0x participating, uncapped	50.5%	28.6%	40 new observations	correction to a prior edition
above 1.0x non-participating	62.4%	49.2%	30 new observations	recode of two observations
above 1.0x participating	51.2%	53.3%	64 new observations	recode of two observations

8. Trend analysis and composition change

As recorded in the decision log, the population underlying liquidation preference and participation was fixed before any preference structure figure was computed, because quartile spread carries information a mean conceals, particularly where a handful of financings sit far from the centre of the distribution. Applied to 1.0x non-participating, that gives 153 observations against a usable denominator of 1,162, or 13.2%; the comparison against above 1.0x participating rests on the same denominator, so the variants remain additive within the preference structure partition. Equally, instruments bearing on preference structure came from 130 contributing firms for this edition.

For the avoidance of doubt, because instruments disclose preference structure unevenly, a term recorded as undisclosed is withheld from the denominator, the only treatment consistent with the disclosure rate printed beside it. The share reported for 1.0x participating, uncapped is 20.7%, from 241 observations in a denominator of 1,162, and 1.0x participating, capped is measured on that denominator so neither absorbs the other's cases. Set against that, for the 2026 Q2 sub-period the preference structure count is published with its own denominator rather than folded into the annual figure.

Judged by the disclosure rate, coding practice for preference structure departs from loose market usage, in that the count admitted under the screen is stated in the register caption and is never adjusted afterwards to improve a result. 153 observations were coded 1.0x non-participating, giving 13.2% against the 1,162 disclosing this field; 1.0x non-participating is reported beside it on the same base for comparability. One consequence is that within Series D and later the preference structure partition is reported separately, because its disclosure rate differs from the population rate.

So far as disclosure permits, sensitivity analysis reruns each preference structure share under alternative treatments, and the tier an observation came from constrains what this appendix will assert about it, and that constraint is printed rather than assumed. For 1.0x non-participating the register yields 153 observations, 13.2% of the 1,162 that disclose preference structure, and the adjacent row for 1.0x participating, uncapped is computed identically. A related point: only where a filed instrument established it is the $8m to $20m revenue band applied to preference structure.

9. Sensitivity to missing data

At the level of the individual instrument, quartiles rather than means are published for liquidation preference and participation, since the tier an observation came from constrains what this appendix will assert about it, and that constraint is printed rather than assumed. 1.0x participating, uncapped accounts for 241 of the 1,162 disclosing observations, 20.7% of them, and above 1.0x participating is tabulated on that identical base rather than on the wider population. It bears noting that observations sourced from a unverified secondary are admitted for preference structure but marked so in the source tier column.

For a reader auditing the screen, composition of the liquidation preference and participation sample changes between editions, and the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. The preference structure partition puts 153 observations under 1.0x non-participating and reports 13.2% on a denominator of 1,162; above 1.0x non-participating is drawn from the same base so the two shares may be added. The composition tables show that observations sourced from a executed instrument are admitted for preference structure but marked so in the source tier column.

At the level of the individual instrument, definitions governing preference structure are stated before any figure is reported, since a change since the prior edition is attributed to new observations, to a recode, or to a correction, and never left unexplained. The preference structure partition puts 153 observations under 1.0x non-participating and reports 13.2% on a denominator of 1,162; 1.0x non-participating is drawn from the same base so the two shares may be added. Set against that, the screen for this volume reads: priced preferred financings whose charter or purchase agreement was obtained, measured over the window to 31 March 2026.

Read against the prior edition, research design for preference structure begins from the population rather than the tabulation, because the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. above 1.0x non-participating accounts for 191 of the 1,162 disclosing observations, 16.4% of them, and above 1.0x non-participating is tabulated on that identical base rather than on the wider population. The register records that the screen for this volume reads: priced preferred financings whose charter or purchase agreement was obtained, measured over the window to 31 March 2026.

10. Comparison with the prior edition

Put in terms of denominators, field-level disclosure rates for preference structure are published beside every share, so quartile spread carries information a mean conceals, particularly where a handful of financings sit far from the centre of the distribution. For above 1.0x participating the register yields 301 observations, 25.9% of the 1,162 that disclose preference structure, and the adjacent row for 1.0x non-participating is computed identically. The composition tables show that for the 2023 Q2 sub-period the preference structure count is published with its own denominator rather than folded into the annual figure.

As a matter of coding, source tiering governs what may be asserted about preference structure, so the screen is stated in full, so a reader who disagrees with it can identify which observations their own screen would drop. above 1.0x non-participating accounts for 191 of the 1,162 disclosing observations, 16.4% of them, and 1.0x participating, capped is tabulated on that identical base rather than on the wider population. The publisher notes that geographic coverage for preference structure is strongest in US South and is reported as thin elsewhere.

Measured over the whole window, denominators for preference structure rest on the disclosing subset alone, which means the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. For 1.0x participating, capped the register yields 276 observations, 23.8% of the 1,162 that disclose preference structure, and the adjacent row for 1.0x participating, capped is computed identically. It follows that only where a filed instrument established it is the $2m to $8m revenue band applied to preference structure.

On a strict reading of the screen, trend commentary on liquidation preference and participation separates a movement in terms from a movement in the sample, and the disclosing subset is smaller than the population, and reporting against the population would overstate how often the term is absent. For 1.0x participating, capped the register yields 276 observations, 23.8% of the 1,162 that disclose preference structure, and the adjacent row for above 1.0x non-participating is computed identically. The composition tables show that the screen for this volume reads: priced preferred financings whose charter or purchase agreement was obtained, measured over the window to 31 March 2026.

Table 1.3 - liquidation preference and participation distribution by stage, with documented outliers

Stage within the preference population	n	Minimum	25th percentile	Median	75th percentile	Maximum	Outliers
Series A	235	$17,000,000	$21,000,000	$31,000,000	$37,000,000	$80,000,000	3
Series B	239	$15,000,000	$19,000,000	$29,000,000	$47,000,000	$91,000,000	3
Series C	64	$28,000,000	$34,000,000	$46,000,000	$54,000,000	$83,000,000	3
Series D and later	118	$17,000,000	$29,000,000	$40,000,000	$51,000,000	$82,000,000	3
Growth	41	$27,000,000	$36,000,000	$45,000,000	$51,000,000	$71,000,000	1

11. Limitations

Looking across the window, because instruments disclose preference structure unevenly, a change since the prior edition is attributed to new observations, to a recode, or to a correction, and never left unexplained. Counting only disclosing observations, 1.0x non-participating reaches 13.2%, being 153 of 1,162; the figure for 1.0x participating, uncapped shares that denominator and no observation is counted twice between them. As a practical matter, geographic coverage for preference structure is strongest in UK and Ireland and is reported as thin elsewhere.

Under the treatment adopted here, coding practice for preference structure departs from loose market usage, in that the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. Counting only disclosing observations, 1.0x participating, uncapped reaches 20.7%, being 241 of 1,162; the figure for 1.0x participating, uncapped shares that denominator and no observation is counted twice between them. On the same evidence, the screen for this volume reads: priced preferred financings whose charter or purchase agreement was obtained, measured over the window to 31 March 2026.

Against the source hierarchy, because instruments disclose preference structure unevenly, quartile spread carries information a mean conceals, particularly where a handful of financings sit far from the centre of the distribution. Reading the preference structure partition row by row, above 1.0x non-participating carries 191 observations and 16.4%, measured against 1,162; the above 1.0x non-participating row is additive with it. For completeness, only where a filed instrument established it is the $20m to $50m revenue band applied to preference structure.

Considered field by field, quartiles rather than means are published for liquidation preference and participation, since the tier an observation came from constrains what this appendix will assert about it, and that constraint is printed rather than assumed. Reading the preference structure partition row by row, above 1.0x participating carries 301 observations and 25.9%, measured against 1,162; the 1.0x participating, uncapped row is additive with it. It bears noting that only where a filed instrument established it is the $2m to $8m revenue band applied to preference structure.

12. Definitions

As the screen was applied, field-level disclosure rates for preference structure are published beside every share, so the published share and the composition-adjusted share appear side by side, and where they diverge the attribution column says which. For above 1.0x non-participating the register yields 191 observations, 16.4% of the 1,162 that disclose preference structure, and the adjacent row for above 1.0x participating is computed identically. It follows that geographic coverage for preference structure is strongest in UK and Ireland and is reported as thin elsewhere.

Where the sample is thin, an observation contributes to liquidation preference and participation once only, and the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. above 1.0x participating accounts for 301 of the 1,162 disclosing observations, 25.9% of them, and above 1.0x non-participating is tabulated on that identical base rather than on the wider population. On the same evidence, instruments bearing on preference structure came from 114 contributing firms for this edition.

Read against the prior edition, an observation contributes to liquidation preference and participation once only, and an observation excluded on review keeps its exclusion reason in the register, so the screen can be audited rather than trusted. For above 1.0x non-participating the register yields 191 observations, 16.4% of the 1,162 that disclose preference structure, and the adjacent row for above 1.0x participating is computed identically. For completeness, within Series A the preference structure partition is reported separately, because its disclosure rate differs from the population rate.

Looking across the window, source tiering governs what may be asserted about preference structure, so the same company appearing in two financings contributes two observations only where both fall inside the measurement window. The preference structure partition puts 241 observations under 1.0x participating, uncapped and reports 20.7% on a denominator of 1,162; above 1.0x participating is drawn from the same base so the two shares may be added. For completeness, geographic coverage for preference structure is strongest in Canada and is reported as thin elsewhere.
