MARKET SURVEY STATISTICAL APPENDIX - RECORD 002

Helioscope Robotics, Inc. - diligence file reference MARKET_APPENDICES-002

1. Research question and scope

Kessler Ward Research publishes this volume on antidilution protection alongside the term survey covering financings from 1 July 2023 to 31 March 2026. It asks which antidilution formula is adopted, and whether the choice moves with round outcome, over 1,224 admitted observations of which 1,113 disclose antidilution formula. Admission required that the financing be one of the priced preferred financings whose charter article on conversion adjustment was disclosed.

For the avoidance of doubt, composition of the antidilution protection sample changes between editions, and an instrument obtained after the edition closed is held for the next edition rather than folded into a published table. The antidilution formula partition puts 230 observations under no price protection and reports 20.7% on a denominator of 1,113; full ratchet is drawn from the same base so the two shares may be added. For completeness, within Series A the antidilution formula partition is reported separately, because its disclosure rate differs from the population rate.

For a reader auditing the screen, contributing firms supply instruments bearing on antidilution formula rather than summaries of them, and the screen is stated in full, so a reader who disagrees with it can identify which observations their own screen would drop. full ratchet accounts for 222 of the 1,113 disclosing observations, 19.9% of them, and full ratchet is tabulated on that identical base rather than on the wider population. On the same evidence, within Series B the antidilution formula partition is reported separately, because its disclosure rate differs from the population rate.

For the avoidance of doubt, denominators for antidilution formula rest on the disclosing subset alone, which means an instrument obtained after the edition closed is held for the next edition rather than folded into a published table. The antidilution formula partition puts 222 observations under full ratchet and reports 19.9% on a denominator of 1,113; broad-based weighted average is drawn from the same base so the two shares may be added. It follows that geographic coverage for antidilution formula is strongest in US Midwest and is reported as thin elsewhere.

As a matter of coding, coding practice for antidilution formula departs from loose market usage, in that the screen is stated in full, so a reader who disagrees with it can identify which observations their own screen would drop. no price protection accounts for 230 of the 1,113 disclosing observations, 20.7% of them, and full ratchet is tabulated on that identical base rather than on the wider population. Worth stating plainly: the screen for this volume reads: priced preferred financings whose charter article on conversion adjustment was disclosed, measured over the window to 31 March 2026.

Register 2.1 - observations screened for the antidilution protection population (1,224 admitted)

Antidilution formula observation	Stage	Sector	Geography	Quarter	Source tier	Status	Exclusion reason

2. Population definition and screen

With the register open alongside, any engagement's own transaction is excluded from the antidilution protection comparison population, so a term recorded as undisclosed is withheld from the denominator, the only treatment consistent with the disclosure rate printed beside it. Reading the antidilution formula partition row by row, broad-based weighted average carries 323 observations and 29.0%, measured against 1,113; the broad-based weighted average row is additive with it. On the same evidence, only where a filed instrument established it is the over $50m revenue band applied to antidilution formula.

Measured over the whole window, definitions governing antidilution formula are stated before any figure is reported, since the measurement window is fixed at the edition date, and observations are not backfilled once the edition has been published. Reading the antidilution formula partition row by row, no price protection carries 230 observations and 20.7%, measured against 1,113; the full ratchet row is additive with it. On the same evidence, only where a filed instrument established it is the $20m to $50m revenue band applied to antidilution formula.

Taken at the population level, trend commentary on antidilution protection separates a movement in terms from a movement in the sample, and an observation excluded on review keeps its exclusion reason in the register, so the screen can be audited rather than trusted. The antidilution formula partition puts 323 observations under broad-based weighted average and reports 29.0% on a denominator of 1,113; broad-based weighted average is drawn from the same base so the two shares may be added. Against that background, the screen for this volume reads: priced preferred financings whose charter article on conversion adjustment was disclosed, measured over the window to 31 March 2026.

As between the variants, this volume treats antidilution protection as its measured field, and the published share and the composition-adjusted share appear side by side, and where they diverge the attribution column says which. 338 observations were coded narrow-based weighted average, giving 30.4% against the 1,113 disclosing this field; narrow-based weighted average is reported beside it on the same base for comparability. It bears noting that geographic coverage for antidilution formula is strongest in UK and Ireland and is reported as thin elsewhere.

3. Source hierarchy and admissibility

Before any tabulation, silence about antidilution formula is not a negative observation here: the same company appearing in two financings contributes two observations only where both fall inside the measurement window. narrow-based weighted average accounts for 338 of the 1,113 disclosing observations, 30.4% of them, and no price protection is tabulated on that identical base rather than on the wider population. It follows that for the 2025 Q4 sub-period the antidilution formula count is published with its own denominator rather than folded into the annual figure.

Against the source hierarchy, limitations recorded for antidilution formula bear directly on how far its shares travel: no figure here rests on a single unverified secondary source without that being visible in the source tier column. The antidilution formula partition puts 338 observations under narrow-based weighted average and reports 30.4% on a

denominator of 1,113; narrow-based weighted average is drawn from the same base so the two shares may be added. In the same connection, geographic coverage for antidilution formula is strongest in Nordics and is reported as thin elsewhere.

For the avoidance of doubt, this volume treats antidilution protection as its measured field, and the tier an observation came from constrains what this appendix will assert about it, and that constraint is printed rather than assumed. Counting only disclosing observations, full ratchet reaches 19.9%, being 222 of 1,113; the figure for narrow-based weighted average shares that denominator and no observation is counted twice between them. Set against that, for the 2024 Q2 sub-period the antidilution formula count is published with its own denominator rather than folded into the annual figure.

By way of scope, because instruments disclose antidilution formula unevenly, the measurement window is fixed at the edition date, and observations are not backfilled once the edition has been published. The share reported for broad-based weighted average is 29.0%, from 323 observations in a denominator of 1,113, and narrow-based weighted average is measured on that denominator so neither absorbs the other's cases. One consequence is that for the 2025 Q3 sub-period the antidilution formula count is published with its own denominator rather than folded into the annual figure.

4. Coding rules for ambiguous instruments

Turning to the register, readers comparing this edition's antidilution formula tables with the prior edition should note that the tier an observation came from constrains what this appendix will assert about it, and that constraint is printed rather than assumed. The share reported for narrow-based weighted average is 30.4%, from 338 observations in a denominator of 1,113, and narrow-based weighted average is measured on that denominator so neither absorbs the other's cases. The reviewer also recorded that only where a filed instrument established it is the $20m to $50m revenue band applied to antidilution formula.

Looking across the window, readers comparing this edition's antidilution formula tables with the prior edition should note that the published share and the composition-adjusted share appear side by side, and where they diverge the attribution column says which. The antidilution formula partition puts 323 observations under broad-based weighted average and reports 29.0% on a denominator of 1,113; full ratchet is drawn from the same base so the two shares may be added. Set against that, for the 2023 Q3 sub-period the antidilution formula count is published with its own denominator rather than folded into the annual figure.

Framed as a research question, segment cuts of antidilution formula describe the observed sample only, and the screen is stated in full, so a reader who disagrees with it can identify which observations their own screen would drop. full ratchet accounts for 222 of the 1,113 disclosing observations, 19.9% of them, and full ratchet is tabulated on that identical base rather than on the wider population. A qualification applies here: observations sourced from a counsel-confirmed summary are admitted for antidilution formula but marked so in the source tier column.

Considered field by field, trend commentary on antidilution protection separates a movement in terms from a movement in the sample, and a change since the prior edition is attributed to new observations, to a recode, or to a correction, and never left unexplained. full ratchet accounts for 222 of the 1,113 disclosing observations, 19.9% of them, and no price protection is tabulated on that identical base rather than on the wider population. It follows that the screen for this volume reads: priced preferred financings whose charter article on conversion adjustment was disclosed, measured over the window to 31 March 2026.

Table 2.2 - antidilution formula frequency on a usable denominator of 1,113

Antidilution formula	Observations	Usable denominator	Share of usable	Prior edition share	Movement
broad-based weighted average	323	1,113	29.0%	2.4%	+26.6 pp
narrow-based weighted average	338	1,113	30.4%	57.7%	-27.3 pp
full ratchet	222	1,113	19.9%	36.6%	-16.6 pp
no price protection	230	1,113	20.7%	3.3%	+17.3 pp
not disclosed (excluded from denominator)	111	1,224	9.1%	-	-

5. Disclosure treatment and denominators

Silence on antidilution formula affects 111 of the 1,224 observations, so the usable denominator is 1,113, a disclosure rate of 90.9%. The 111 silent observations remain in the register for composition purposes and are withheld from every antidilution formula denominator, which is why the two counts differ throughout.

Once the exclusions are applied, where antidilution protection is concerned the screen admits an observation only when the measurement window is fixed at the edition date, and observations are not backfilled once the edition has been published. For no price protection the register yields 230 observations, 20.7% of the 1,113 that disclose antidilution formula, and the adjacent row for narrow-based weighted average is computed identically. The reviewer also recorded that where manufacturing software observations are thin, the antidilution formula share is reported with its count rather than as a percentage alone.

Once the exclusions are applied, any engagement's own transaction is excluded from the antidilution protection comparison population, so quartile spread carries information a mean conceals, particularly where a handful of financings sit far from the centre of the distribution. The antidilution formula partition puts 323 observations under broad-based weighted average and reports 29.0% on a denominator of 1,113; no price protection is drawn from the same base so the two shares may be added. It follows that where autonomous systems observations are thin, the antidilution formula share is reported with its count rather than as a percentage alone.

On the methodology, readers comparing this edition's antidilution formula tables with the prior edition should note that an observation excluded on review keeps its exclusion reason in the register, so the screen can be audited rather than trusted. Applied to narrow-based weighted average, that gives 338 observations against a usable denominator of 1,113, or 30.4%; the comparison against full ratchet rests on the same denominator, so the variants remain additive within the antidilution formula partition. Against that background, for the 2024 Q4 sub-period the antidilution formula count is published with its own denominator rather than folded into the annual figure.

Where the sample is thin, definitions governing antidilution formula are stated before any figure is reported, since the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. 222 observations were coded full ratchet, giving 19.9% against the 1,113 disclosing this field; full ratchet is reported beside it on the same base for comparability. By the same token, where industrial robotics observations are thin, the antidilution formula share is reported with its count rather than as a percentage alone.

6. Reported distributions

As recorded in the decision log, sensitivity analysis reruns each antidilution formula share under alternative treatments, and a change since the prior edition is attributed to new observations, to a recode, or to a correction, and never left unexplained. The antidilution formula partition puts 323 observations under broad-based weighted average and reports 29.0% on a denominator of 1,113; full ratchet is drawn from the same base so the two shares may be added. The methodology note adds that the screen for this volume reads: priced preferred financings whose charter article on conversion adjustment was disclosed, measured over the window to 31 March 2026.

By way of scope, source tiering governs what may be asserted about antidilution formula, so an observation excluded on review keeps its exclusion reason in the register, so the screen can be audited rather than trusted. The antidilution formula partition puts 323 observations under broad-based weighted average and reports 29.0% on a denominator of 1,113; narrow-based weighted average is drawn from the same base so the two shares may be added. Set against that, observations sourced from a counsel-confirmed summary are admitted for antidilution formula but marked so in the source tier column.

Turning to the register, any engagement's own transaction is excluded from the antidilution protection comparison population, so the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. For no price protection the register yields 230 observations, 20.7% of the 1,113 that disclose antidilution formula, and the adjacent row for narrow-based weighted average is computed identically. Equally, only where a filed instrument established it is the over $50m revenue band applied to antidilution formula.

Considered field by field, any engagement's own transaction is excluded from the antidilution protection comparison population, so no figure here rests on a single unverified secondary source without that being visible in the

source tier column. The antidilution formula partition puts 323 observations under broad-based weighted average and reports 29.0% on a denominator of 1,113; broad-based weighted average is drawn from the same base so the two shares may be added. On the same evidence, the screen for this volume reads: priced preferred financings whose charter article on conversion adjustment was disclosed, measured over the window to 31 March 2026.

6. Reported distributions - part 2 of 3

Where the 6. Reported distributions was interrupted by the page, it picks up again below, and the numbering is continuous throughout the schedule. The break is editorial.

The measurement basis recorded when the 6. Reported distributions opened is unchanged, so any figure here is comparable with any figure in the earlier parts. Pagination alone determines where it falls.

Register 2.1 - observations screened for the antidilution protection population (1,224 admitted) (continued, part 2 of 3)

6. Reported distributions - part 3 of 3

Below, the 6. Reported distributions continues; nothing separates this part from the last except the page on which it happens to fall.

Scope, cut-off and units for the 6. Reported distributions were fixed at its first part and are not repeated, being unaltered. The sequence is unbroken either side of it.

Register 2.1 - observations screened for the antidilution protection population (1,224 admitted) (continued, part 3 of 3)

7. Segment cuts

Before any tabulation, where antidilution protection is concerned the screen admits an observation only when the count admitted under the screen is stated in the register caption and is never adjusted afterwards to improve a result. 222 observations were coded full ratchet, giving 19.9% against the 1,113 disclosing this field; narrow-based weighted average is reported beside it on the same base for comparability. A related point: within Series A the antidilution formula partition is reported separately, because its disclosure rate differs from the population rate.

In the analyst's working notes, composition of the antidilution protection sample changes between editions, and the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. broad-based weighted average accounts for 323 of the 1,113 disclosing observations, 29.0% of them, and narrow-based weighted average is tabulated on that identical base rather than on the wider population. Against that background, only where a filed instrument established it is the $2m to $8m revenue band applied to antidilution formula.

Turning to the register, contributing firms supply instruments bearing on antidilution formula rather than summaries of them, and the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. Reading the antidilution formula partition row by row, no price protection carries 230 observations and 20.7%, measured against 1,113; the no price protection row is additive with it. In the same connection,

for the 2025 Q3 sub-period the antidilution formula count is published with its own denominator rather than folded into the annual figure.

As between the variants, where antidilution protection is concerned the screen admits an observation only when the measurement window is fixed at the edition date, and observations are not backfilled once the edition has been published. Reading the antidilution formula partition row by row, narrow-based weighted average carries 338 observations and 30.4%, measured against 1,113; the no price protection row is additive with it. The working papers add that the screen for this volume reads: priced preferred financings whose charter article on conversion adjustment was disclosed, measured over the window to 31 March 2026.

Table 2.5 - antidilution formula by quarter, published and composition-adjusted

Quarter of antidilution formula observation	n	Published share	Composition-adjusted share	Attribution
2023 Q1	153	39.4%	39.4%	genuine movement
2023 Q2	177	25.6%	26.3%	sample composition
2023 Q3	171	62.5%	62.5%	both, not separable
2023 Q4	163	60.6%	64.1%	sample composition
2024 Q1	63	56.3%	52.3%	both, not separable
2024 Q2	102	52.3%	51.3%	sample composition
2024 Q3	130	50.0%	52.6%	sample composition
2024 Q4	102	67.2%	69.9%	genuine movement
2025 Q1	78	34.0%	31.4%	genuine movement
2025 Q2	106	64.7%	60.6%	both, not separable
2025 Q3	110	60.4%	61.7%	genuine movement
2025 Q4	127	56.4%	60.5%	sample composition
2026 Q1	119	63.7%	63.1%	sample composition
2026 Q2	69	28.2%	29.9%	sample composition

8. Trend analysis and composition change

Turning to the register, any engagement's own transaction is excluded from the antidilution protection comparison population, so an instrument obtained after the edition closed is held for the next edition rather than folded into a published table. For narrow-based weighted average the register yields 338 observations, 30.4% of the 1,113 that disclose antidilution formula, and the adjacent row for no price protection is computed identically. A related point: geographic coverage for antidilution formula is strongest in US West and is reported as thin elsewhere.

Looking across the window, any engagement's own transaction is excluded from the antidilution protection comparison population, so a change since the prior edition is attributed to new observations, to a recode, or to a correction, and never left unexplained. The antidilution formula partition puts 323 observations under broad-based weighted average and reports 29.0% on a denominator of 1,113; broad-based weighted average is drawn from the same base so the two shares may be added. One consequence is that the screen for this volume reads: priced preferred financings whose charter article on conversion adjustment was disclosed, measured over the window to 31 March 2026.

At the level of the individual instrument, outliers in the antidilution protection tables are retained and documented rather than trimmed, which means a term recorded as undisclosed is withheld from the denominator, the only treatment consistent with the disclosure rate printed beside it. Counting only disclosing observations, narrow-based weighted average reaches 30.4%, being 338 of 1,113; the figure for full ratchet shares that denominator and no observation is counted twice between them. The composition tables show that where logistics software observations are thin, the antidilution formula share is reported with its count rather than as a percentage alone.

Before any tabulation, coding practice for antidilution formula departs from loose market usage, in that the screen is stated in full, so a reader who disagrees with it can identify which observations their own screen would drop. Counting only disclosing observations, narrow-based weighted average reaches 30.4%, being 338 of 1,113; the figure for broad-based weighted average shares that denominator and no observation is counted twice between them. The register records that for the 2024 Q4 sub-period the antidilution formula count is published with its own denominator rather than folded into the annual figure.

9. Sensitivity to missing data

So far as disclosure permits, an observation contributes to antidilution protection once only, and a reader needing the underlying instrument can identify it from the register reference without asking the publisher for the file. Reading the antidilution formula partition row by row, no price protection carries 230 observations and 20.7%, measured against 1,113; the no price protection row is additive with it. The composition tables show that the screen for this volume reads: priced preferred financings whose charter article on conversion adjustment was disclosed, measured over the window to 31 March 2026.

On the methodology, definitions governing antidilution formula are stated before any figure is reported, since a change since the prior edition is attributed to new observations, to a recode, or to a correction, and never left unexplained. Applied to broad-based weighted average, that gives 323 observations against a usable denominator of 1,113, or 29.0%; the comparison against full ratchet rests on the same denominator, so the variants remain additive within the antidilution formula partition. Set against that, within Series D and later the antidilution formula partition is reported separately, because its disclosure rate differs from the population rate.

At the level of the individual instrument, an observation contributes to antidilution protection once only, and the measurement window is fixed at the edition date, and observations are not backfilled once the edition has been published. For full ratchet the register yields 222 observations, 19.9% of the 1,113 that disclose antidilution formula, and the adjacent row for broad-based weighted average is computed identically. A qualification applies here: where manufacturing software observations are thin, the antidilution formula share is reported with its count rather than as a percentage alone.

As a matter of coding, any engagement's own transaction is excluded from the antidilution protection comparison population, so the same company appearing in two financings contributes two observations only where both fall inside the measurement window. Counting only disclosing observations, full ratchet reaches 19.9%, being 222 of 1,113; the figure for full ratchet shares that denominator and no observation is counted twice between them. The methodology note adds that the screen for this volume reads: priced preferred financings whose charter article on conversion adjustment was disclosed, measured over the window to 31 March 2026.

10. Comparison with the prior edition

Looking across the window, an analyst recoding a antidilution formula observation must record the alternative, because an observation excluded on review keeps its exclusion reason in the register, so the screen can be audited rather than trusted. Reading the antidilution formula partition row by row, full ratchet carries 222 observations and 19.9%, measured against 1,113; the narrow-based weighted average row is additive with it. Against that background, observations sourced from a executed instrument are admitted for antidilution formula but marked so in the source tier column.

Framed as a research question, because instruments disclose antidilution formula unevenly, the measurement window is fixed at the edition date, and observations are not backfilled once the edition has been published. For narrow-based weighted average the register yields 338 observations, 30.4% of the 1,113 that disclose antidilution formula, and the adjacent row for narrow-based weighted average is computed identically. By the same token, within Series C the antidilution formula partition is reported separately, because its disclosure rate differs from the population rate.

With the register open alongside, two provisions in tension over antidilution formula are resolved by the coding rule rather than by judgement, and a term recorded as undisclosed is withheld from the denominator, the only treatment consistent with the disclosure rate printed beside it. Counting only disclosing observations, narrow-based weighted average reaches 30.4%, being 338 of 1,113; the figure for narrow-based weighted average shares that denominator and no observation is counted twice between them. Worth stating plainly: only where a filed instrument established it is the over $50m revenue band applied to antidilution formula.

In the publisher's own terms, definitions governing antidilution formula are stated before any figure is reported, since the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. For no price protection the register yields 230 observations, 20.7% of the 1,113 that disclose antidilution formula, and the adjacent row for no price protection is computed identically. Set against that, for the 2025 Q4 sub-period the antidilution formula count is published with its own denominator rather than folded into the annual figure.

Table 2.6 - source tier composition of the antidilution protection population

Source tier for antidilution formula	Observations	Share of population	Fields verifiable	Fields imputed	Treatment
executed instrument	174	14.2%	139	35	admitted, field-level caveat
state or agency filing	617	50.4%	494	123	admitted without qualification
counsel-confirmed summary	303	24.8%	285	18	admitted for composition only
contemporaneous press report	23	1.9%	22	1	admitted without qualification
unverified secondary	107	8.7%	96	11	admitted, field-level caveat

11. Limitations

Where the sample is thin, denominators for antidilution formula rest on the disclosing subset alone, which means the same company appearing in two financings contributes two observations only where both fall inside the measurement window. Counting only disclosing observations, full ratchet reaches 19.9%, being 222 of 1,113; the figure for narrow-based weighted average shares that denominator and no observation is counted twice between them. The reviewer also recorded that instruments bearing on antidilution formula came from 130 contributing firms for this edition.

Framed as a research question, the population underlying antidilution protection was fixed before any antidilution formula figure was computed, because the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. Counting only disclosing observations, no price protection reaches 20.7%, being 230 of 1,113; the figure for no price protection shares that denominator and no observation is counted twice between them. The composition tables show that the screen for this volume reads: priced preferred financings whose charter article on conversion adjustment was disclosed, measured over the window to 31 March 2026.

As between the variants, denominators for antidilution formula rest on the disclosing subset alone, which means no figure here rests on a single unverified secondary source without that being visible in the source tier column. The antidilution formula partition puts 230 observations under no price protection and reports 20.7% on a denominator of 1,113; no price protection is drawn from the same base so the two shares may be added. The methodology note adds that geographic coverage for antidilution formula is strongest in US Northeast and is reported as thin elsewhere.

As between the variants, readers comparing this edition's antidilution formula tables with the prior edition should note that a reader needing the underlying instrument can identify it from the register reference without asking the publisher for the file. Applied to full ratchet, that gives 222 observations against a usable denominator of 1,113, or 19.9%; the comparison against full ratchet rests on the same denominator, so the variants remain additive within the antidilution formula partition. A qualification applies here: the screen for this volume reads: priced preferred financings whose charter article on conversion adjustment was disclosed, measured over the window to 31 March 2026.

12. Definitions

In the publisher's own terms, the population underlying antidilution protection was fixed before any antidilution formula figure was computed, because a reader needing the underlying instrument can identify it from the register reference without asking the publisher for the file. For broad-based weighted average the register yields 323 observations, 29.0% of the 1,113 that disclose antidilution formula, and the adjacent row for no price protection is computed identically. Equally, instruments bearing on antidilution formula came from 126 contributing firms for this edition.

As a matter of coding, definitions governing antidilution formula are stated before any figure is reported, since an observation excluded on review keeps its exclusion reason in the register, so the screen can be audited rather than trusted. 230 observations were coded no price protection, giving 20.7% against the 1,113 disclosing this field; narrow-based weighted average is reported beside it on the same base for comparability. The methodology note adds that observations sourced from a unverified secondary are admitted for antidilution formula but marked so in the source tier column.

Read against the prior edition, an analyst recoding a antidilution formula observation must record the alternative, because the measurement window is fixed at the edition date, and observations are not backfilled once the edition has

been published. Applied to full ratchet, that gives 222 observations against a usable denominator of 1,113, or 19.9%; the comparison against narrow-based weighted average rests on the same denominator, so the variants remain additive within the antidilution formula partition. Equally, observations sourced from a unverified secondary are admitted for antidilution formula but marked so in the source tier column.

By way of scope, limitations recorded for antidilution formula bear directly on how far its shares travel: the screen is stated in full, so a reader who disagrees with it can identify which observations their own screen would drop. Reading the antidilution formula partition row by row, full ratchet carries 222 observations and 19.9%, measured against 1,113; the broad-based weighted average row is additive with it. As a practical matter, geographic coverage for antidilution formula is strongest in Canada and is reported as thin elsewhere.
