MARKET SURVEY STATISTICAL APPENDIX - RECORD 003

Helioscope Robotics, Inc. - diligence file reference MARKET_APPENDICES-003

1. Research question and scope

Kessler Ward Research publishes this volume on board composition and protective provisions alongside the term survey covering financings from 1 July 2023 to 31 March 2026. It asks how board seats are allocated at the round, and which matters are made subject to a class vote, over 1,181 admitted observations of which 1,039 disclose investor board designation. Observations were drawn from contributing firms and admitted where financings whose voting agreement or charter board article was obtained.

With the register open alongside, limitations recorded for investor board designation bear directly on how far its shares travel: the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. The share reported for investor seat plus observer is 6.4%, from 67 observations in a denominator of 1,039, and two investor seats is measured on that denominator so neither absorbs the other's cases. It bears noting that for the 2023 Q1 sub-period the investor board designation count is published with its own denominator rather than folded into the annual figure.

For a reader auditing the screen, silence about investor board designation is not a negative observation here: an instrument obtained after the edition closed is held for the next edition rather than folded into a published table. For no designation right the register yields 449 observations, 43.2% of the 1,039 that disclose investor board designation, and the adjacent row for no designation right is computed identically. As a practical matter, where machine vision observations are thin, the investor board designation share is reported with its count rather than as a percentage alone.

For a reader auditing the screen, readers comparing this edition's investor board designation tables with the prior edition should note that the screen is stated in full, so a reader who disagrees with it can identify which observations their own screen would drop. Applied to one investor seat, that gives 36 observations against a usable denominator of 1,039, or 3.5%; the comparison against investor seat plus observer rests on the same denominator, so the variants remain additive within the investor board designation partition. It follows that where fleet telematics observations are thin, the investor board designation share is reported with its count rather than as a percentage alone.

By way of scope, silence about investor board designation is not a negative observation here: the screen is stated in full, so a reader who disagrees with it can identify which observations their own screen would drop. The investor board designation partition puts 67 observations under investor seat plus observer and reports 6.4% on a denominator of 1,039; investor seat plus observer is drawn from the same base so the two shares may be added. In the same connection, observations sourced from a unverified secondary are admitted for investor board designation but marked so in the source tier column.

Register 3.1 - observations screened for the board composition and protective provisions population (1,181 admitted)

1. Research question and scope - part 2 of 3

Set out next is the balance of the 1. Research question and scope, in the sequence in which the rows were originally compiled. The break is editorial.

Column definitions stated with the first part of the 1. Research question and scope govern the whole of it, and any qualification recorded there is carried forward here. The sequence is unbroken either side of it.

Register 3.1 - observations screened for the board composition and protective provisions population (1,181 admitted) (continued, part 2 of 3)

2. Population definition and screen

Measured over the whole window, trend commentary on board composition and protective provisions separates a movement in terms from a movement in the sample, and the screen is stated in full, so a reader who disagrees with it can identify which observations their own screen would drop. Counting only disclosing observations, investor seat plus observer reaches 6.4%, being 67 of 1,039; the figure for observer only shares that denominator and no observation is counted twice between them. For completeness, observations sourced from a counsel-confirmed summary are admitted for investor board designation but marked so in the source tier column.

As a matter of coding, outliers in the board composition and protective provisions tables are retained and documented rather than trimmed, which means the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. 67 observations were coded investor seat plus observer, giving 6.4% against the 1,039 disclosing this field; no designation right is reported beside it on the same base for comparability. It follows that instruments bearing on investor board designation came from 131 contributing firms for this edition.

At the level of the individual instrument, composition of the board composition and protective provisions sample changes between editions, and a change since the prior edition is attributed to new observations, to a recode, or to a correction, and never left unexplained. 449 observations were coded no designation right, giving 43.2% against the 1,039 disclosing this field; investor seat plus observer is reported beside it on the same base for comparability. The reviewer also recorded that geographic coverage for investor board designation is strongest in US Midwest and is reported as thin elsewhere.

In the analyst's working notes, silence about investor board designation is not a negative observation here: quartile spread carries information a mean conceals, particularly where a handful of financings sit far from the centre of the distribution. no designation right accounts for 449 of the 1,039 disclosing observations, 43.2% of them, and observer only is tabulated on that identical base rather than on the wider population. Equally, observations sourced from a contemporaneous press report are admitted for investor board designation but marked so in the source tier column.

3. Source hierarchy and admissibility

On a strict reading of the screen, trend commentary on board composition and protective provisions separates a movement in terms from a movement in the sample, and an observation excluded on review keeps its exclusion reason in the register, so the screen can be audited rather than trusted. 67 observations were coded investor seat plus observer, giving 6.4% against the 1,039 disclosing this field; no designation right is reported beside it on the same base for comparability. On the same evidence, only where a filed instrument established it is the $8m to $20m revenue band applied to investor board designation.

Turning to the register, readers comparing this edition's investor board designation tables with the prior edition should note that the published share and the composition-adjusted share appear side by side, and where they diverge the attribution column says which. The investor board designation partition puts 36 observations under one investor seat and reports 3.5% on a denominator of 1,039; one investor seat is drawn from the same base so the two shares may be added. On the same evidence, for the 2024 Q2 sub-period the investor board designation count is published with its own denominator rather than folded into the annual figure.

As a matter of coding, segment cuts of investor board designation describe the observed sample only, and the published share and the composition-adjusted share appear side by side, and where they diverge the attribution column says which. Counting only disclosing observations, observer only reaches 21.3%, being 221 of 1,039; the figure for no designation right shares that denominator and no observation is counted twice between them. One consequence is that where machine vision observations are thin, the investor board designation share is reported with its count rather than as a percentage alone.

As a matter of coding, trend commentary on board composition and protective provisions separates a movement in terms from a movement in the sample, and no figure here rests on a single unverified secondary source without that being visible in the source tier column. The share reported for investor seat plus observer is 6.4%, from 67 observations in a denominator of 1,039, and investor seat plus observer is measured on that denominator so neither absorbs the other's cases. As a practical matter, the screen for this volume reads: financings whose voting agreement or charter board article was obtained, measured over the window to 31 March 2026.

4. Coding rules for ambiguous instruments

Looking across the window, because instruments disclose investor board designation unevenly, the published share and the composition-adjusted share appear side by side, and where they diverge the attribution column says which. one investor seat accounts for 36 of the 1,039 disclosing observations, 3.5% of them, and one investor seat is tabulated on that identical base rather than on the wider population. A qualification applies here: within Series C the investor board designation partition is reported separately, because its disclosure rate differs from the population rate.

On the methodology, field-level disclosure rates for investor board designation are published beside every share, so an instrument obtained after the edition closed is held for the next edition rather than folded into a published table. Counting only disclosing observations, investor seat plus observer reaches 6.4%, being 67 of 1,039; the figure for one investor seat shares that denominator and no observation is counted twice between them. For completeness, for the 2026 Q1 sub-period the investor board designation count is published with its own denominator rather than folded into the annual figure.

As the screen was applied, research design for investor board designation begins from the population rather than the tabulation, because the measurement window is fixed at the edition date, and observations are not backfilled once the edition has been published. The share reported for two investor seats is 25.6%, from 266 observations in a denominator of 1,039, and no designation right is measured on that denominator so neither absorbs the other's cases. The working papers

add that observations sourced from a executed instrument are admitted for investor board designation but marked so in the source tier column.

Read against the prior edition, silence about investor board designation is not a negative observation here: a change since the prior edition is attributed to new observations, to a recode, or to a correction, and never left unexplained. 36 observations were coded one investor seat, giving 3.5% against the 1,039 disclosing this field; investor seat plus observer is reported beside it on the same base for comparability. The composition tables show that instruments bearing on investor board designation came from 112 contributing firms for this edition.

Table 3.2 - investor board designation frequency on a usable denominator of 1,039

Investor board designation	Observations	Usable denominator	Share of usable	Prior edition share	Movement
one investor seat	36	1,039	3.5%	18.2%	-14.7 pp
two investor seats	266	1,039	25.6%	11.5%	+14.1 pp
investor seat plus observer	67	1,039	6.4%	29.2%	-22.7 pp
observer only	221	1,039	21.3%	21.6%	-0.3 pp
no designation right	449	1,039	43.2%	19.5%	+23.7 pp
not disclosed (excluded from denominator)	142	1,181	12.0%	-	-

5. Disclosure treatment and denominators

The screen for board composition and protective provisions admits 1,181 observations, of which 142 say nothing about investor board designation, a disclosure rate of 88.0%. Shares for investor board designation are therefore computed on 1,039; treating the silent observations as though the term were absent would understate how often it is taken.

Considered field by field, readers comparing this edition's investor board designation tables with the prior edition should note that the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. two investor seats accounts for 266 of the 1,039 disclosing observations, 25.6% of them, and no designation right is tabulated on that identical base rather than on the wider population. By the same token, where machine vision observations are thin, the investor board designation share is reported with its count rather than as a percentage alone.

On a strict reading of the screen, sensitivity analysis reruns each investor board designation share under alternative treatments, and the measurement window is fixed at the edition date, and observations are not backfilled once the edition has been published. Counting only disclosing observations, one investor seat reaches 3.5%, being 36 of 1,039; the figure for observer only shares that denominator and no observation is counted twice between them. In the same connection, geographic coverage for investor board designation is strongest in US West and is reported as thin elsewhere.

Put in terms of denominators, an analyst recoding a investor board designation observation must record the alternative, because the same company appearing in two financings contributes two observations only where both fall inside the measurement window. For investor seat plus observer the register yields 67 observations, 6.4% of the 1,039 that disclose investor board designation, and the adjacent row for one investor seat is computed identically. On the same evidence, geographic coverage for investor board designation is strongest in Nordics and is reported as thin elsewhere.

Looking across the window, coding practice for investor board designation departs from loose market usage, in that the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. Reading the investor board designation partition row by row, two investor seats carries 266 observations and 25.6%, measured against 1,039; the two investor seats row is additive with it. In the same connection, where fleet telematics observations are thin, the investor board designation share is reported with its count rather than as a percentage alone.

6. Reported distributions

Read against the prior edition, composition of the board composition and protective provisions sample changes between editions, and the disclosing subset is smaller than the population, and reporting against the population would overstate how often the term is absent. For two investor seats the register yields 266 observations, 25.6% of the 1,039 that disclose investor board designation, and the adjacent row for two investor seats is computed identically. The publisher

notes that where logistics software observations are thin, the investor board designation share is reported with its count rather than as a percentage alone.

Where the sample is thin, field-level disclosure rates for investor board designation are published beside every share, so the tier an observation came from constrains what this appendix will assert about it, and that constraint is printed rather than assumed. no designation right accounts for 449 of the 1,039 disclosing observations, 43.2% of them, and two investor seats is tabulated on that identical base rather than on the wider population. The publisher notes that within Series D and later the investor board designation partition is reported separately, because its disclosure rate differs from the population rate.

So far as disclosure permits, research design for investor board designation begins from the population rather than the tabulation, because the screen is stated in full, so a reader who disagrees with it can identify which observations their own screen would drop. Reading the investor board designation partition row by row, observer only carries 221 observations and 21.3%, measured against 1,039; the investor seat plus observer row is additive with it. The publisher notes that where fleet telematics observations are thin, the investor board designation share is reported with its count rather than as a percentage alone.

Under the treatment adopted here, source tiering governs what may be asserted about investor board designation, so the same company appearing in two financings contributes two observations only where both fall inside the measurement window. Applied to investor seat plus observer, that gives 67 observations against a usable denominator of 1,039, or 6.4%; the comparison against one investor seat rests on the same denominator, so the variants remain additive within the investor board designation partition. A qualification applies here: where industrial robotics observations are thin, the investor board designation share is reported with its count rather than as a percentage alone.

6. Reported distributions - part 2 of 3

Below, the 6. Reported distributions continues; nothing separates this part from the last except the page on which it happens to fall. The sequence is unbroken either side of it.

Qualifications noted at the head of the 6. Reported distributions apply to these rows equally, and are not restated for each part. Nothing is restated from the earlier part.

Register 3.1 - observations screened for the board composition and protective provisions population (1,181 admitted) (continued, part 2 of 3)

7. Segment cuts

So far as disclosure permits, trend commentary on board composition and protective provisions separates a movement in terms from a movement in the sample, and a change since the prior edition is attributed to new observations, to a recode, or to a correction, and never left unexplained. Applied to investor seat plus observer, that gives 67 observations against a usable denominator of 1,039, or 6.4%; the comparison against investor seat plus observer rests on the same denominator, so the variants remain additive within the investor board designation partition. The register records that for the 2025 Q4 sub-period the investor board designation count is published with its own denominator rather than folded into the annual figure.

Against the source hierarchy, any engagement's own transaction is excluded from the board composition and protective provisions comparison population, so the published share and the composition-adjusted share appear side by side, and where they diverge the attribution column says which. Counting only disclosing observations, investor seat plus observer reaches 6.4%, being 67 of 1,039; the figure for investor seat plus observer shares that denominator and no observation is counted twice between them. A qualification applies here: instruments bearing on investor board designation came from 117 contributing firms for this edition.

Judged by the disclosure rate, where board composition and protective provisions is concerned the screen admits an observation only when no figure here rests on a single unverified secondary source without that being visible in the source tier column. Reading the investor board designation partition row by row, investor seat plus observer carries 67 observations and 6.4%, measured against 1,039; the investor seat plus observer row is additive with it. Worth stating plainly: only where a filed instrument established it is the $2m to $8m revenue band applied to investor board designation.

By way of scope, the population underlying board composition and protective provisions was fixed before any investor board designation figure was computed, because a term recorded as undisclosed is withheld from the denominator, the only treatment consistent with the disclosure rate printed beside it. 449 observations were coded no designation right, giving 43.2% against the 1,039 disclosing this field; no designation right is reported beside it on the same base for comparability. In the same connection, within Series B the investor board designation partition is reported separately, because its disclosure rate differs from the population rate.

Table 3.4 - board composition and protective provisions cell counts by sector and stage, each cell carrying its own denominator

Sector within the board population	Series A	Series B	Series C	Series D and later	Growth	Row total
industrial robotics	28	34	29	11	32	134
warehouse	10	10	17	15	10	62

Sector within the board population	Series A	Series B	Series C	Series D and later	Growth	Row total
automation						
logistics software	7	30	28	27	18	110
supply-chain analytics	4	22	8	34	8	76
machine vision	33	28	9	5	21	96
autonomous systems	32	10	5	25	34	106
manufacturing software	26	4	31	12	13	86
fleet telematics	9	16	9	13	15	62
Column total	149	154	136	142	151	732

8. Trend analysis and composition change

By way of scope, outliers in the board composition and protective provisions tables are retained and documented rather than trimmed, which means the screen is stated in full, so a reader who disagrees with it can identify which observations their own screen would drop. investor seat plus observer accounts for 67 of the 1,039 disclosing observations, 6.4% of them, and investor seat plus observer is tabulated on that identical base rather than on the wider population. A related point: geographic coverage for investor board designation is strongest in US West and is reported as thin elsewhere.

Where the sample is thin, because instruments disclose investor board designation unevenly, the same company appearing in two financings contributes two observations only where both fall inside the measurement window. Reading the investor board designation partition row by row, observer only carries 221 observations and 21.3%, measured against 1,039; the no designation right row is additive with it. The reviewer also recorded that observations sourced from a state or agency filing are admitted for investor board designation but marked so in the source tier column.

Under the treatment adopted here, quartiles rather than means are published for board composition and protective provisions, since the screen is stated in full, so a reader who disagrees with it can identify which observations their own screen would drop. investor seat plus observer accounts for 67 of the 1,039 disclosing observations, 6.4% of them, and investor seat plus observer is tabulated on that identical base rather than on the wider population. The publisher notes that for the 2023 Q3 sub-period the investor board designation count is published with its own denominator rather than folded into the annual figure.

As the screen was applied, denominators for investor board designation rest on the disclosing subset alone, which means a change since the prior edition is attributed to new observations, to a recode, or to a correction, and never left unexplained. For two investor seats the register yields 266 observations, 25.6% of the 1,039 that disclose investor board designation, and the adjacent row for investor seat plus observer is computed identically. The reviewer also recorded that only where a filed instrument established it is the under $2m revenue band applied to investor board designation.

9. Sensitivity to missing data

Taken at the population level, quartiles rather than means are published for board composition and protective provisions, since the same company appearing in two financings contributes two observations only where both fall inside the measurement window. Applied to one investor seat, that gives 36 observations against a usable denominator of 1,039, or 3.5%; the comparison against one investor seat rests on the same denominator, so the variants remain additive within the investor board designation partition. The composition tables show that the screen for this volume reads: financings whose voting agreement or charter board article was obtained, measured over the window to 31 March 2026.

Once the exclusions are applied, any engagement's own transaction is excluded from the board composition and protective provisions comparison population, so the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. The share reported for no designation right is 43.2%, from 449 observations in a denominator of 1,039, and one investor seat is measured on that denominator so neither absorbs the other's cases. By the same token, for the 2023 Q2 sub-period the investor board designation count is published with its own denominator rather than folded into the annual figure.

For the avoidance of doubt, any engagement's own transaction is excluded from the board composition and protective provisions comparison population, so the screen is stated in full, so a reader who disagrees with it can identify which observations their own screen would drop. The share reported for investor seat plus observer is 6.4%, from 67 observations in a denominator of 1,039, and one investor seat is measured on that denominator so neither absorbs the other's cases. The methodology note adds that instruments bearing on investor board designation came from 125 contributing firms for this edition.

Taken at the population level, source tiering governs what may be asserted about investor board designation, so a reader needing the underlying instrument can identify it from the register reference without asking the publisher for the file. The investor board designation partition puts 266 observations under two investor seats and reports 25.6% on a denominator of 1,039; two investor seats is drawn from the same base so the two shares may be added. In the same connection, observations sourced from a executed instrument are admitted for investor board designation but marked so in the source tier column.

10. Comparison with the prior edition

Under the treatment adopted here, sensitivity analysis reruns each investor board designation share under alternative treatments, and a term recorded as undisclosed is withheld from the denominator, the only treatment consistent with the disclosure rate printed beside it. Applied to two investor seats, that gives 266 observations against a usable denominator of 1,039, or 25.6%; the comparison against no designation right rests on the same denominator, so the variants remain additive within the investor board designation partition. A qualification applies here: where industrial robotics observations are thin, the investor board designation share is reported with its count rather than as a percentage alone.

Under the treatment adopted here, readers comparing this edition's investor board designation tables with the prior edition should note that the measurement window is fixed at the edition date, and observations are not backfilled once the edition has been published. The share reported for one investor seat is 3.5%, from 36 observations in a denominator of 1,039, and no designation right is measured on that denominator so neither absorbs the other's cases. The working papers add that only where a filed instrument established it is the $2m to $8m revenue band applied to investor board designation.

Before any tabulation, where board composition and protective provisions is concerned the screen admits an observation only when the same company appearing in two financings contributes two observations only where both fall inside the measurement window. Applied to investor seat plus observer, that gives 67 observations against a usable denominator of 1,039, or 6.4%; the comparison against observer only rests on the same denominator, so the variants remain additive within the investor board designation partition. The composition tables show that the screen for this volume reads: financings whose voting agreement or charter board article was obtained, measured over the window to 31 March 2026.

So far as disclosure permits, contributing firms supply instruments bearing on investor board designation rather than summaries of them, and the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. The share reported for no designation right is 43.2%, from 449 observations in a denominator of 1,039, and investor seat plus observer is measured on that denominator so neither absorbs the other's cases. It bears noting that where manufacturing software observations are thin, the investor board designation share is reported with its count rather than as a percentage alone.

Table 3.5 - investor board designation by quarter, published and composition-adjusted

Quarter of investor board designation observation	n	Published share	Composition-adjusted share	Attribution
2023 Q1	176	27.4%	29.4%	sample composition
2023 Q2	95	64.4%	68.0%	sample composition
2023 Q3	172	41.6%	41.4%	both, not separable
2023 Q4	79	47.2%	48.7%	both, not separable
2024 Q1	101	50.9%	48.9%	both, not separable
2024 Q2	163	65.4%	61.8%	both, not separable
2024 Q3	133	49.0%	48.1%	genuine movement
2024 Q4	152	54.8%	56.6%	sample composition

Quarter of investor board designation observation	n	Published share	Composition-adjusted share	Attribution
2025 Q1	97	28.3%	24.2%	sample composition
2025 Q2	79	39.1%	43.8%	sample composition
2025 Q3	122	29.6%	27.1%	genuine movement
2025 Q4	91	36.2%	35.5%	both, not separable
2026 Q1	95	64.8%	67.2%	sample composition
2026 Q2	107	54.9%	57.1%	both, not separable

11. Limitations

As recorded in the decision log, any engagement's own transaction is excluded from the board composition and protective provisions comparison population, so the same company appearing in two financings contributes two observations only where both fall inside the measurement window. Counting only disclosing observations, investor seat plus observer reaches 6.4%, being 67 of 1,039; the figure for observer only shares that denominator and no observation is counted twice between them. It follows that for the 2025 Q2 sub-period the investor board designation count is published with its own denominator rather than folded into the annual figure.

For the avoidance of doubt, readers comparing this edition's investor board designation tables with the prior edition should note that a change since the prior edition is attributed to new observations, to a recode, or to a correction, and never left unexplained. For two investor seats the register yields 266 observations, 25.6% of the 1,039 that disclose investor board designation, and the adjacent row for investor seat plus observer is computed identically. Set against that, where autonomous systems observations are thin, the investor board designation share is reported with its count rather than as a percentage alone.

Read against the prior edition, where board composition and protective provisions is concerned the screen admits an observation only when an observation excluded on review keeps its exclusion reason in the register, so the screen can be audited rather than trusted. Reading the investor board designation partition row by row, one investor seat carries 36 observations and 3.5%, measured against 1,039; the no designation right row is additive with it. As a practical matter, only where a filed instrument established it is the $20m to $50m revenue band applied to investor board designation.

Against the source hierarchy, field-level disclosure rates for investor board designation are published beside every share, so a term recorded as undisclosed is withheld from the denominator, the only treatment consistent with the disclosure rate printed beside it. For two investor seats the register yields 266 observations, 25.6% of the 1,039 that disclose investor board designation, and the adjacent row for investor seat plus observer is computed identically. Worth stating plainly: for the 2025 Q4 sub-period the investor board designation count is published with its own denominator rather than folded into the annual figure.

12. Definitions

Turning to the register, any engagement's own transaction is excluded from the board composition and protective provisions comparison population, so the screen is stated in full, so a reader who disagrees with it can identify which observations their own screen would drop. 266 observations were coded two investor seats, giving 25.6% against the 1,039 disclosing this field; one investor seat is reported beside it on the same base for comparability. By the same token, only where a filed instrument established it is the $8m to $20m revenue band applied to investor board designation.

Looking across the window, this volume treats board composition and protective provisions as its measured field, and the same company appearing in two financings contributes two observations only where both fall inside the measurement window. investor seat plus observer accounts for 67 of the 1,039 disclosing observations, 6.4% of them, and observer only is tabulated on that identical base rather than on the wider population. A related point: for the 2025 Q2 sub-period the investor board designation count is published with its own denominator rather than folded into the annual figure.

At the level of the individual instrument, readers comparing this edition's investor board designation tables with the prior edition should note that the same company appearing in two financings contributes two observations only where both fall inside the measurement window. Reading the investor board designation partition row by row, no designation right carries 449 observations and 43.2%, measured against 1,039; the two investor seats row is additive with it. By the

same token, the screen for this volume reads: financings whose voting agreement or charter board article was obtained, measured over the window to 31 March 2026.

Framed as a research question, where board composition and protective provisions is concerned the screen admits an observation only when the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. 449 observations were coded no designation right, giving 43.2% against the 1,039 disclosing this field; no designation right is reported beside it on the same base for comparability. The methodology note adds that the screen for this volume reads: financings whose voting agreement or charter board article was obtained, measured over the window to 31 March 2026.
