MARKET SURVEY STATISTICAL APPENDIX - RECORD 005

Helioscope Robotics, Inc. - diligence file reference MARKET_APPENDICES-005

1. Research question and scope

Kessler Ward Research publishes this volume on option pool sizing at close alongside the term survey covering financings from 1 July 2023 to 31 March 2026. It asks how large the post-closing reserve is set, and which side of the round bears its dilution, over 864 admitted observations of which 682 disclose pool dilution basis. The screen admitting them reads: financings whose term sheet or charter recites a pool covenant.

Where the sample is thin, trend commentary on option pool sizing at close separates a movement in terms from a movement in the sample, and a term recorded as undisclosed is withheld from the denominator, the only treatment consistent with the disclosure rate printed beside it. Reading the pool dilution basis partition row by row, no pool change at close carries 84 observations and 12.3%, measured against 682; the pre-money, borne by existing holders row is additive with it. A qualification applies here: observations sourced from a contemporaneous press report are admitted for pool dilution basis but marked so in the source tier column.

Turning to the register, this volume treats option pool sizing at close as its measured field, and the count admitted under the screen is stated in the register caption and is never adjusted afterwards to improve a result. Reading the pool dilution basis partition row by row, no pool change at close carries 84 observations and 12.3%, measured against 682; the pre-money, borne by existing holders row is additive with it. For completeness, within Growth the pool dilution basis partition is reported separately, because its disclosure rate differs from the population rate.

Set beside the composition tables, because instruments disclose pool dilution basis unevenly, the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. no pool change at close accounts for 84 of the 682 disclosing observations, 12.3% of them, and pre-money, borne by existing holders is tabulated on that identical base rather than on the wider population. The methodology note adds that only where a filed instrument established it is the $8m to $20m revenue band applied to pool dilution basis.

By way of scope, silence about pool dilution basis is not a negative observation here: a change since the prior edition is attributed to new observations, to a recode, or to a correction, and never left unexplained. For no pool change at close the register yields 84 observations, 12.3% of the 682 that disclose pool dilution basis, and the adjacent row for pre-money, borne by existing holders is computed identically. A qualification applies here: within Series D and later the pool dilution basis partition is reported separately, because its disclosure rate differs from the population rate.

Register 5.1 - observations screened for the option pool sizing at close population (864 admitted)

1. Research question and scope - part 2 of 3

Presentation of the 1. Research question and scope carries on below without restarting the row numbers, the break being one of pagination only. The parts are to be read together.

The measurement basis recorded when the 1. Research question and scope opened is unchanged, so any figure here is comparable with any figure in the earlier parts. Pagination alone determines where it falls.

Register 5.1 - observations screened for the option pool sizing at close population (864 admitted) (continued, part 2 of 3)

1. Research question and scope - part 3 of 3

Below, the 1. Research question and scope continues; nothing separates this part from the last except the page on which it happens to fall. The parts are to be read together.

Because the basis of the 1. Research question and scope is unchanged, figures in this part may be compared directly with those already given. Nothing is restated from the earlier part.

Register 5.1 - observations screened for the option pool sizing at close population (864 admitted) (continued, part 3 of 3)

2. Population definition and screen

In the publisher's own terms, because instruments disclose pool dilution basis unevenly, the tier an observation came from constrains what this appendix will assert about it, and that constraint is printed rather than assumed. For no pool change at close the register yields 84 observations, 12.3% of the 682 that disclose pool dilution basis, and the adjacent row for post-money, shared is computed identically. As a practical matter, instruments bearing on pool dilution basis came from 129 contributing firms for this edition.

Where the sample is thin, where option pool sizing at close is concerned the screen admits an observation only when quartile spread carries information a mean conceals, particularly where a handful of financings sit far from the centre of the distribution. post-money, shared accounts for 278 of the 682 disclosing observations, 40.8% of them, and no pool change at close is tabulated on that identical base rather than on the wider population. Worth stating plainly: where warehouse automation observations are thin, the pool dilution basis share is reported with its count rather than as a percentage alone.

By way of scope, denominators for pool dilution basis rest on the disclosing subset alone, which means quartile spread carries information a mean conceals, particularly where a handful of financings sit far from the centre of the distribution. For no pool change at close the register yields 84 observations, 12.3% of the 682 that disclose pool dilution basis, and the adjacent row for pre-money, borne by existing holders is computed identically. Equally, the screen for this volume reads: financings whose term sheet or charter recites a pool covenant, measured over the window to 31 March 2026.

Taken at the population level, where option pool sizing at close is concerned the screen admits an observation only when a term recorded as undisclosed is withheld from the denominator, the only treatment consistent with the disclosure rate printed beside it. Applied to pre-money, borne by existing holders, that gives 195 observations against a usable denominator of 682, or 28.6%; the comparison against no pool change at close rests on the same denominator, so the variants remain additive within the pool dilution basis partition. The reviewer also recorded that the screen for this volume reads: financings whose term sheet or charter recites a pool covenant, measured over the window to 31 March 2026.

3. Source hierarchy and admissibility

Read against the prior edition, an observation contributes to option pool sizing at close once only, and the published share and the composition-adjusted share appear side by side, and where they diverge the attribution column says which. pre-money with partial sharing accounts for 125 of the 682 disclosing observations, 18.3% of them, and no pool change at close is tabulated on that identical base rather than on the wider population. It bears noting that for the 2023 Q2 sub-period the pool dilution basis count is published with its own denominator rather than folded into the annual figure.

Before any tabulation, research design for pool dilution basis begins from the population rather than the tabulation, because the count admitted under the screen is stated in the register caption and is never adjusted afterwards to improve a result. Applied to no pool change at close, that gives 84 observations against a usable denominator of 682, or 12.3%; the comparison against pre-money, borne by existing holders rests on the same denominator, so the variants remain additive within the pool dilution basis partition. By the same token, for the 2024 Q3 sub-period the pool dilution basis count is published with its own denominator rather than folded into the annual figure.

Set beside the composition tables, an observation contributes to option pool sizing at close once only, and a change since the prior edition is attributed to new observations, to a recode, or to a correction, and never left unexplained. Counting only disclosing observations, post-money, shared reaches 40.8%, being 278 of 682; the figure for pre-money with partial sharing shares that denominator and no observation is counted twice between them. A qualification applies here: observations sourced from a counsel-confirmed summary are admitted for pool dilution basis but marked so in the source tier column.

Under the treatment adopted here, two provisions in tension over pool dilution basis are resolved by the coding rule rather than by judgement, and the count admitted under the screen is stated in the register caption and is never adjusted afterwards to improve a result. Reading the pool dilution basis partition row by row, pre-money, borne by existing holders carries 195 observations and 28.6%, measured against 682; the pre-money, borne by existing holders row is additive with it. The publisher notes that observations sourced from a counsel-confirmed summary are admitted for pool dilution basis but marked so in the source tier column.

4. Coding rules for ambiguous instruments

Turning to the register, this volume treats option pool sizing at close as its measured field, and the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. For pre-money, borne by existing holders the register yields 195 observations, 28.6% of the 682 that disclose pool dilution basis, and the adjacent row for no pool change at close is computed identically. The reviewer also recorded that geographic coverage for pool dilution basis is strongest in DACH and is reported as thin elsewhere.

As a matter of coding, definitions governing pool dilution basis are stated before any figure is reported, since the tier an observation came from constrains what this appendix will assert about it, and that constraint is printed rather than assumed. 84 observations were coded no pool change at close, giving 12.3% against the 682 disclosing this field; no pool change at close is reported beside it on the same base for comparability. On the same evidence, only where a filed instrument established it is the $2m to $8m revenue band applied to pool dilution basis.

Before any tabulation, the population underlying option pool sizing at close was fixed before any pool dilution basis figure was computed, because no figure here rests on a single unverified secondary source without that being visible in the source tier column. Reading the pool dilution basis partition row by row, pre-money, borne by existing holders carries 195 observations and 28.6%, measured against 682; the pre-money with partial sharing row is additive with it. Against that background, where manufacturing software observations are thin, the pool dilution basis share is reported with its count rather than as a percentage alone.

By way of scope, two provisions in tension over pool dilution basis are resolved by the coding rule rather than by judgement, and the disclosing subset is smaller than the population, and reporting against the population would overstate how often the term is absent. Applied to pre-money with partial sharing, that gives 125 observations against a usable denominator of 682, or 18.3%; the comparison against pre-money with partial sharing rests on the same denominator, so the variants remain additive within the pool dilution basis partition. The register records that only where a filed instrument established it is the $2m to $8m revenue band applied to pool dilution basis.

Table 5.2 - pool dilution basis frequency on a usable denominator of 682

Pool dilution basis	Observations	Usable denominator	Share of usable	Prior edition share	Movement
pre-money, borne by existing holders	195	682	28.6%	45.5%	-16.9 pp
post-money, shared	278	682	40.8%	45.5%	-4.7 pp
pre-money with partial sharing	125	682	18.3%	7.9%	+10.4 pp
no pool change at close	84	682	12.3%	1.2%	+11.1 pp
not disclosed (excluded from denominator)	182	864	21.1%	-	-

5. Disclosure treatment and denominators

Reading only what the instruments say, 682 of 864 observations state a pool dilution basis, a disclosure rate of 78.9%. No table in this volume divides by 864. Doing so would credit the silent observations with an absence of pool dilution basis that no instrument supports.

Put in terms of denominators, this volume treats option pool sizing at close as its measured field, and an observation excluded on review keeps its exclusion reason in the register, so the screen can be audited rather than trusted. 278 observations were coded post-money, shared, giving 40.8% against the 682 disclosing this field; pre-money, borne by existing holders is reported beside it on the same base for comparability. A related point: observations sourced from a contemporaneous press report are admitted for pool dilution basis but marked so in the source tier column.

Where the sample is thin, silence about pool dilution basis is not a negative observation here: the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. pre-money, borne by existing holders accounts for 195 of the 682 disclosing observations, 28.6% of them, and no pool change at close is tabulated on that identical base rather than on the wider population. The register records that within Series C the pool dilution basis partition is reported separately, because its disclosure rate differs from the population rate.

Framed as a research question, two provisions in tension over pool dilution basis are resolved by the coding rule rather than by judgement, and the disclosing subset is smaller than the population, and reporting against the population would overstate how often the term is absent. The share reported for no pool change at close is 12.3%, from 84 observations in a denominator of 682, and no pool change at close is measured on that denominator so neither absorbs the other's cases. A related point: only where a filed instrument established it is the $8m to $20m revenue band applied to pool dilution basis.

Turning to the register, two provisions in tension over pool dilution basis are resolved by the coding rule rather than by judgement, and an observation excluded on review keeps its exclusion reason in the register, so the screen can be audited rather than trusted. Counting only disclosing observations, post-money, shared reaches 40.8%, being 278 of 682; the figure for pre-money with partial sharing shares that denominator and no observation is counted twice between them. By the same token, geographic coverage for pool dilution basis is strongest in Nordics and is reported as thin elsewhere.

6. Reported distributions

At the level of the individual instrument, an analyst recoding a pool dilution basis observation must record the alternative, because the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. post-money, shared accounts for 278 of the 682 disclosing observations, 40.8% of them, and pre-money with partial sharing is tabulated on that identical base rather than on the wider population. By the same token, for the 2023 Q2 sub-period the pool dilution basis count is published with its own denominator rather than folded into the annual figure.

Put in terms of denominators, two provisions in tension over pool dilution basis are resolved by the coding rule rather than by judgement, and the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. The pool dilution basis partition puts 84 observations under no pool change at close and reports 12.3% on a denominator of 682; no pool change at close is drawn from the same base so the two shares may be added. Worth stating plainly: only where a filed instrument established it is the $20m to $50m revenue band applied to pool dilution basis.

Where the sample is thin, silence about pool dilution basis is not a negative observation here: the measurement window is fixed at the edition date, and observations are not backfilled once the edition has been published. Reading the pool dilution basis partition row by row, pre-money with partial sharing carries 125 observations and 18.3%, measured against 682; the post-money, shared row is additive with it. Equally, where warehouse automation observations are thin, the pool dilution basis share is reported with its count rather than as a percentage alone.

Put in terms of denominators, this volume treats option pool sizing at close as its measured field, and the disclosing subset is smaller than the population, and reporting against the population would overstate how often the term is absent. The pool dilution basis partition puts 278 observations under post-money, shared and reports 40.8% on a denominator of 682; post-money, shared is drawn from the same base so the two shares may be added. The working papers add that for the 2024 Q2 sub-period the pool dilution basis count is published with its own denominator rather than folded into the annual figure.

6. Reported distributions - part 2 of 3

Because the 6. Reported distributions does not fit one page, its remainder is set out below under the same references. Pagination alone determines where it falls.

Because the basis of the 6. Reported distributions is unchanged, figures in this part may be compared directly with those already given. Nothing is restated from the earlier part.

Register 5.1 - observations screened for the option pool sizing at close population (864 admitted) (continued, part 2 of 3)

7. Segment cuts

In the publisher's own terms, sensitivity analysis reruns each pool dilution basis share under alternative treatments, and a term recorded as undisclosed is withheld from the denominator, the only treatment consistent with the disclosure rate printed beside it. The share reported for no pool change at close is 12.3%, from 84 observations in a denominator of 682, and post-money, shared is measured on that denominator so neither absorbs the other's cases. Equally, the screen for this volume reads: financings whose term sheet or charter recites a pool covenant, measured over the window to 31 March 2026.

Under the treatment adopted here, readers comparing this edition's pool dilution basis tables with the prior edition should note that an instrument obtained after the edition closed is held for the next edition rather than folded into a published table. The share reported for post-money, shared is 40.8%, from 278 observations in a denominator of 682, and no pool change at close is measured on that denominator so neither absorbs the other's cases. Against that background, the screen for this volume reads: financings whose term sheet or charter recites a pool covenant, measured over the window to 31 March 2026.

With the register open alongside, definitions governing pool dilution basis are stated before any figure is reported, since the measurement window is fixed at the edition date, and observations are not backfilled once the edition has been published. The pool dilution basis partition puts 195 observations under pre-money, borne by existing holders and reports 28.6% on a denominator of 682; pre-money, borne by existing holders is drawn from the same base so the two shares may be added. The working papers add that where autonomous systems observations are thin, the pool dilution basis share is reported with its count rather than as a percentage alone.

On a strict reading of the screen, segment cuts of pool dilution basis describe the observed sample only, and a reader needing the underlying instrument can identify it from the register reference without asking the publisher for the file. Counting only disclosing observations, pre-money with partial sharing reaches 18.3%, being 125 of 682; the figure for pre-money, borne by existing holders shares that denominator and no observation is counted twice between them. It follows that only where a filed instrument established it is the under $2m revenue band applied to pool dilution basis.

Table 5.8 - sensitivity of pool dilution basis shares to missing-data treatment

Pool dilution basis under alternative treatment	Published	Missing counted absent	Missing imputed	Usable denominator	Conclusion
pre-money, borne by existing holders	48.2%	39.1%	54.1%	682	sensitive
post-money, shared	15.1%	12.4%	18.1%	682	stable
pre-money with partial sharing	36.1%	30.5%	44.9%	682	sensitive
no pool change at close	44.0%	38.0%	52.4%	682	sensitive

8. Trend analysis and composition change

Before any tabulation, field-level disclosure rates for pool dilution basis are published beside every share, so the tier an observation came from constrains what this appendix will assert about it, and that constraint is printed rather than assumed. Counting only disclosing observations, pre-money, borne by existing holders reaches 28.6%, being 195 of 682; the figure for no pool change at close shares that denominator and no observation is counted twice between them. Set against that, for the 2024 Q2 sub-period the pool dilution basis count is published with its own denominator rather than folded into the annual figure.

As the screen was applied, segment cuts of pool dilution basis describe the observed sample only, and the published share and the composition-adjusted share appear side by side, and where they diverge the attribution column says which. Counting only disclosing observations, no pool change at close reaches 12.3%, being 84 of 682; the figure for pre-money,

borne by existing holders shares that denominator and no observation is counted twice between them. As a practical matter, geographic coverage for pool dilution basis is strongest in US West and is reported as thin elsewhere.

As the screen was applied, field-level disclosure rates for pool dilution basis are published beside every share, so the count admitted under the screen is stated in the register caption and is never adjusted afterwards to improve a result. Counting only disclosing observations, pre-money, borne by existing holders reaches 28.6%, being 195 of 682; the figure for pre-money, borne by existing holders shares that denominator and no observation is counted twice between them. On the same evidence, instruments bearing on pool dilution basis came from 120 contributing firms for this edition.

Under the treatment adopted here, any engagement's own transaction is excluded from the option pool sizing at close comparison population, so an instrument obtained after the edition closed is held for the next edition rather than folded into a published table. For no pool change at close the register yields 84 observations, 12.3% of the 682 that disclose pool dilution basis, and the adjacent row for post-money, shared is computed identically. Worth stating plainly: geographic coverage for pool dilution basis is strongest in Canada and is reported as thin elsewhere.

9. Sensitivity to missing data

In this volume's presentation, an observation contributes to option pool sizing at close once only, and a term recorded as undisclosed is withheld from the denominator, the only treatment consistent with the disclosure rate printed beside it. The share reported for no pool change at close is 12.3%, from 84 observations in a denominator of 682, and pre-money with partial sharing is measured on that denominator so neither absorbs the other's cases. Against that background, only where a filed instrument established it is the $20m to $50m revenue band applied to pool dilution basis.

Looking across the window, readers comparing this edition's pool dilution basis tables with the prior edition should note that the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. Applied to pre-money with partial sharing, that gives 125 observations against a usable denominator of 682, or 18.3%; the comparison against pre-money with partial sharing rests on the same denominator, so the variants remain additive within the pool dilution basis partition. The reviewer also recorded that the screen for this volume reads: financings whose term sheet or charter recites a pool covenant, measured over the window to 31 March 2026.

Where the sample is thin, limitations recorded for pool dilution basis bear directly on how far its shares travel: an observation excluded on review keeps its exclusion reason in the register, so the screen can be audited rather than trusted. 84 observations were coded no pool change at close, giving 12.3% against the 682 disclosing this field; pre-money, borne by existing holders is reported beside it on the same base for comparability. Worth stating plainly: geographic coverage for pool dilution basis is strongest in US Northeast and is reported as thin elsewhere.

Once the exclusions are applied, because instruments disclose pool dilution basis unevenly, quartile spread carries information a mean conceals, particularly where a handful of financings sit far from the centre of the distribution. 125 observations were coded pre-money with partial sharing, giving 18.3% against the 682 disclosing this field; no pool change at close is reported beside it on the same base for comparability. The working papers add that within Series D and later the pool dilution basis partition is reported separately, because its disclosure rate differs from the population rate.

10. Comparison with the prior edition

Before any tabulation, an analyst recoding a pool dilution basis observation must record the alternative, because the screen is stated in full, so a reader who disagrees with it can identify which observations their own screen would drop. For post-money, shared the register yields 278 observations, 40.8% of the 682 that disclose pool dilution basis, and the adjacent row for no pool change at close is computed identically. The publisher notes that instruments bearing on pool dilution basis came from 125 contributing firms for this edition.

With the register open alongside, segment cuts of pool dilution basis describe the observed sample only, and the measurement window is fixed at the edition date, and observations are not backfilled once the edition has been published. 195 observations were coded pre-money, borne by existing holders, giving 28.6% against the 682 disclosing this field; no pool change at close is reported beside it on the same base for comparability. Set against that, geographic coverage for pool dilution basis is strongest in US South and is reported as thin elsewhere.

As between the variants, source tiering governs what may be asserted about pool dilution basis, so no figure here rests on a single unverified secondary source without that being visible in the source tier column. pre-money, borne by existing holders accounts for 195 of the 682 disclosing observations, 28.6% of them, and pre-money with partial sharing is tabulated on that identical base rather than on the wider population. On the same evidence, instruments bearing on pool dilution basis came from 114 contributing firms for this edition.

Turning to the register, this volume treats option pool sizing at close as its measured field, and a term recorded as undisclosed is withheld from the denominator, the only treatment consistent with the disclosure rate printed beside it. pre-money, borne by existing holders accounts for 195 of the 682 disclosing observations, 28.6% of them, and no pool change at close is tabulated on that identical base rather than on the wider population. The composition tables show that observations sourced from a executed instrument are admitted for pool dilution basis but marked so in the source tier column.

Table 5.9 - movement in pool dilution basis against the prior edition, by cause

Pool dilution basis movement	Prior edition	This edition	Underlying change	Attributed cause
pre-money, borne by existing holders	55.8%	30.5%	23 new observations	recode of two observations
post-money, shared	46.6%	22.8%	40 new observations	new observations only
pre-money with partial sharing	52.3%	31.7%	45 new observations	new observations only
no pool change at close	48.4%	58.9%	25 new observations	recode of two observations

11. Limitations

Judged by the disclosure rate, two provisions in tension over pool dilution basis are resolved by the coding rule rather than by judgement, and no figure here rests on a single unverified secondary source without that being visible in the source tier column. For pre-money, borne by existing holders the register yields 195 observations, 28.6% of the 682 that disclose pool dilution basis, and the adjacent row for pre-money with partial sharing is computed identically. It bears noting that geographic coverage for pool dilution basis is strongest in DACH and is reported as thin elsewhere.

On a strict reading of the screen, any engagement's own transaction is excluded from the option pool sizing at close comparison population, so the measurement window is fixed at the edition date, and observations are not backfilled once the edition has been published. Reading the pool dilution basis partition row by row, post-money, shared carries 278 observations and 40.8%, measured against 682; the pre-money, borne by existing holders row is additive with it. The working papers add that where machine vision observations are thin, the pool dilution basis share is reported with its count rather than as a percentage alone.

As between the variants, coding practice for pool dilution basis departs from loose market usage, in that the same company appearing in two financings contributes two observations only where both fall inside the measurement window. 195 observations were coded pre-money, borne by existing holders, giving 28.6% against the 682 disclosing this field; pre-money, borne by existing holders is reported beside it on the same base for comparability. On the same evidence, only where a filed instrument established it is the under $2m revenue band applied to pool dilution basis.

In the publisher's own terms, an analyst recoding a pool dilution basis observation must record the alternative, because an observation excluded on review keeps its exclusion reason in the register, so the screen can be audited rather than trusted. 84 observations were coded no pool change at close, giving 12.3% against the 682 disclosing this field; no pool change at close is reported beside it on the same base for comparability. The publisher notes that the screen for this volume reads: financings whose term sheet or charter recites a pool covenant, measured over the window to 31 March 2026.

12. Definitions

As recorded in the decision log, readers comparing this edition's pool dilution basis tables with the prior edition should note that a reader needing the underlying instrument can identify it from the register reference without asking the publisher for the file. For no pool change at close the register yields 84 observations, 12.3% of the 682 that disclose pool dilution basis, and the adjacent row for no pool change at close is computed identically. Against that background, geographic coverage for pool dilution basis is strongest in US South and is reported as thin elsewhere.

Where the sample is thin, readers comparing this edition's pool dilution basis tables with the prior edition should note that the published share and the composition-adjusted share appear side by side, and where they diverge the attribution column says which. pre-money with partial sharing accounts for 125 of the 682 disclosing observations, 18.3% of them, and no pool change at close is tabulated on that identical base rather than on the wider population. Set against that, geographic coverage for pool dilution basis is strongest in UK and Ireland and is reported as thin elsewhere.

Where the sample is thin, readers comparing this edition's pool dilution basis tables with the prior edition should note that an instrument obtained after the edition closed is held for the next edition rather than folded into a published table. Reading the pool dilution basis partition row by row, post-money, shared carries 278 observations and 40.8%, measured against 682; the post-money, shared row is additive with it. In the same connection, geographic coverage for pool dilution basis is strongest in US Northeast and is reported as thin elsewhere.

So far as disclosure permits, composition of the option pool sizing at close sample changes between editions, and the disclosing subset is smaller than the population, and reporting against the population would overstate how often the term is absent. Reading the pool dilution basis partition row by row, pre-money, borne by existing holders carries 195 observations and 28.6%, measured against 682; the no pool change at close row is additive with it. It follows that where autonomous systems observations are thin, the pool dilution basis share is reported with its count rather than as a percentage alone.
