MARKET SURVEY STATISTICAL APPENDIX - RECORD 006

Helioscope Robotics, Inc. - diligence file reference MARKET_APPENDICES-006

1. Research question and scope

Kessler Ward Research publishes this volume on tranched and milestone-conditioned funding alongside the term survey covering financings from 1 July 2023 to 31 March 2026. It asks how often a round is split into tranches, and what condition releases the later money, over 842 admitted observations of which 707 disclose tranche release condition. Observations were drawn from contributing firms and admitted where financings whose purchase agreement closing conditions were obtained.

Judged by the disclosure rate, segment cuts of tranche release condition describe the observed sample only, and the measurement window is fixed at the edition date, and observations are not backfilled once the edition has been published. 168 observations were coded product or technical milestone, giving 23.8% against the 707 disclosing this field; single close, no tranche is reported beside it on the same base for comparability. By the same token, where industrial robotics observations are thin, the tranche release condition share is reported with its count rather than as a percentage alone.

In the analyst's working notes, trend commentary on tranched and milestone-conditioned funding separates a movement in terms from a movement in the sample, and a change since the prior edition is attributed to new observations, to a recode, or to a correction, and never left unexplained. The share reported for date-certain only is 15.4%, from 109 observations in a denominator of 707, and single close, no tranche is measured on that denominator so neither absorbs the other's cases. The register records that where fleet telematics observations are thin, the tranche release condition share is reported with its count rather than as a percentage alone.

Before any tabulation, where tranched and milestone-conditioned funding is concerned the screen admits an observation only when the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. The share reported for revenue or bookings milestone is 0.7%, from 5 observations in a denominator of 707, and single close, no tranche is measured on that denominator so neither absorbs the other's cases. The reviewer also recorded that geographic coverage for tranche release condition is strongest in US Midwest and is reported as thin elsewhere.

On the methodology, outliers in the tranched and milestone-conditioned funding tables are retained and documented rather than trimmed, which means the screen is stated in full, so a reader who disagrees with it can identify which observations their own screen would drop. The share reported for board discretion is 38.5%, from 272 observations in a denominator of 707, and board discretion is measured on that denominator so neither absorbs the other's cases. The methodology note adds that instruments bearing on tranche release condition came from 114 contributing firms for this edition.

Register 6.1 - observations screened for the tranched and milestone-conditioned funding population (842 admitted)

1. Research question and scope - part 2 of 3

Below, the 1. Research question and scope continues; nothing separates this part from the last except the page on which it happens to fall. The break is editorial.

Qualifications noted at the head of the 1. Research question and scope apply to these rows equally, and are not restated for each part. Pagination alone determines where it falls.

Register 6.1 - observations screened for the tranched and milestone-conditioned funding population (842 admitted) (continued, part 2 of 3)

1. Research question and scope - part 3 of 3

Set out next is the balance of the 1. Research question and scope, in the sequence in which the rows were originally compiled. No row is omitted at the join.

Column definitions stated with the first part of the 1. Research question and scope govern the whole of it, and any qualification recorded there is carried forward here. The parts are to be read together.

Register 6.1 - observations screened for the tranched and milestone-conditioned funding population (842 admitted) (continued, part 3 of 3)

2. Population definition and screen

Once the exclusions are applied, research design for tranche release condition begins from the population rather than the tabulation, because a reader needing the underlying instrument can identify it from the register reference without asking the publisher for the file. The tranche release condition partition puts 272 observations under board discretion and reports 38.5% on a denominator of 707; board discretion is drawn from the same base so the two shares may be added. A related point: for the 2024 Q4 sub-period the tranche release condition count is published with its own denominator rather than folded into the annual figure.

Read against the prior edition, limitations recorded for tranche release condition bear directly on how far its shares travel: the same company appearing in two financings contributes two observations only where both fall inside the measurement window. product or technical milestone accounts for 168 of the 707 disclosing observations, 23.8% of them, and single close, no tranche is tabulated on that identical base rather than on the wider population. The reviewer also recorded that geographic coverage for tranche release condition is strongest in US South and is reported as thin elsewhere.

On a strict reading of the screen, sensitivity analysis reruns each tranche release condition share under alternative treatments, and the screen is stated in full, so a reader who disagrees with it can identify which observations their own screen would drop. Reading the tranche release condition partition row by row, product or technical milestone carries 168 observations and 23.8%, measured against 707; the single close, no tranche row is additive with it. On the same evidence, for the 2026 Q1 sub-period the tranche release condition count is published with its own denominator rather than folded into the annual figure.

As recorded in the decision log, two provisions in tension over tranche release condition are resolved by the coding rule rather than by judgement, and the measurement window is fixed at the edition date, and observations are not backfilled once the edition has been published. The tranche release condition partition puts 109 observations under date-certain only and reports 15.4% on a denominator of 707; product or technical milestone is drawn from the same base so the two shares may be added. Set against that, where industrial robotics observations are thin, the tranche release condition share is reported with its count rather than as a percentage alone.

3. Source hierarchy and admissibility

Turning to the register, this volume treats tranched and milestone-conditioned funding as its measured field, and the same company appearing in two financings contributes two observations only where both fall inside the measurement window. The share reported for product or technical milestone is 23.8%, from 168 observations in a denominator of 707, and product or technical milestone is measured on that denominator so neither absorbs the other's cases. One consequence is that geographic coverage for tranche release condition is strongest in US South and is reported as thin elsewhere.

Put in terms of denominators, research design for tranche release condition begins from the population rather than the tabulation, because the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. Applied to revenue or bookings milestone, that gives 5 observations against a usable denominator of 707, or 0.7%; the comparison against revenue or bookings milestone rests on the same denominator, so the variants remain additive within the tranche release condition partition. One consequence is that geographic coverage for tranche release condition is strongest in DACH and is reported as thin elsewhere.

By way of scope, because instruments disclose tranche release condition unevenly, a term recorded as undisclosed is withheld from the denominator, the only treatment consistent with the disclosure rate printed beside it. The tranche release condition partition puts 168 observations under product or technical milestone and reports 23.8% on a denominator of 707; single close, no tranche is drawn from the same base so the two shares may be added. It bears noting that within Series C the tranche release condition partition is reported separately, because its disclosure rate differs from the population rate.

On the methodology, the population underlying tranched and milestone-conditioned funding was fixed before any tranche release condition figure was computed, because the disclosing subset is smaller than the population, and reporting against the population would overstate how often the term is absent. 168 observations were coded product or technical milestone, giving 23.8% against the 707 disclosing this field; board discretion is reported beside it on the same base for comparability. The publisher notes that where fleet telematics observations are thin, the tranche release condition share is reported with its count rather than as a percentage alone.

4. Coding rules for ambiguous instruments

Set beside the composition tables, an observation contributes to tranched and milestone-conditioned funding once only, and a change since the prior edition is attributed to new observations, to a recode, or to a correction, and never left unexplained. Reading the tranche release condition partition row by row, date-certain only carries 109 observations and 15.4%, measured against 707; the product or technical milestone row is additive with it. It bears noting that only where a filed instrument established it is the under $2m revenue band applied to tranche release condition.

Before any tabulation, the population underlying tranched and milestone-conditioned funding was fixed before any tranche release condition figure was computed, because the disclosing subset is smaller than the population, and reporting against the population would overstate how often the term is absent. The tranche release condition partition puts 153 observations under single close, no tranche and reports 21.6% on a denominator of 707; date-certain only is drawn from the same base so the two shares may be added. In the same connection, observations sourced from a counsel-confirmed summary are admitted for tranche release condition but marked so in the source tier column.

Before any tabulation, because instruments disclose tranche release condition unevenly, a change since the prior edition is attributed to new observations, to a recode, or to a correction, and never left unexplained. 168 observations were coded product or technical milestone, giving 23.8% against the 707 disclosing this field; product or technical milestone is reported beside it on the same base for comparability. In the same connection, where supply-chain analytics observations are thin, the tranche release condition share is reported with its count rather than as a percentage alone.

On the methodology, research design for tranche release condition begins from the population rather than the tabulation, because the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. Counting only disclosing observations, product or technical milestone reaches 23.8%, being 168 of 707; the figure for single close, no tranche shares that denominator and no observation is counted twice between them. Worth stating plainly: only where a filed instrument established it is the under $2m revenue band applied to tranche release condition.

Table 6.2 - tranche release condition frequency on a usable denominator of 707

Tranche release condition	Observations	Usable denominator	Share of usable	Prior edition share	Movement
revenue or bookings milestone	5	707	0.7%	2.1%	-1.4 pp
product or technical milestone	168	707	23.8%	17.1%	+6.6 pp
board discretion	272	707	38.5%	32.5%	+5.9 pp
date-certain only	109	707	15.4%	27.0%	-11.6 pp
single close, no tranche	153	707	21.6%	21.2%	+0.4 pp
not disclosed (excluded from denominator)	135	842	16.0%	-	-

5. Disclosure treatment and denominators

Disclosure runs to 707 of 842 observations for tranche release condition, the balance of 135 being silent, a disclosure rate of 84.0%. The 135 silent observations remain in the register for composition purposes and are withheld from every tranche release condition denominator, which is why the two counts differ throughout.

On the methodology, trend commentary on tranched and milestone-conditioned funding separates a movement in terms from a movement in the sample, and no figure here rests on a single unverified secondary source without that being visible in the source tier column. Counting only disclosing observations, board discretion reaches 38.5%, being 272 of 707; the figure for product or technical milestone shares that denominator and no observation is counted twice between them. Worth stating plainly: observations sourced from a contemporaneous press report are admitted for tranche release condition but marked so in the source tier column.

Against the source hierarchy, an analyst recoding a tranche release condition observation must record the alternative, because the tier an observation came from constrains what this appendix will assert about it, and that constraint is printed rather than assumed. Counting only disclosing observations, board discretion reaches 38.5%, being 272 of 707; the figure for product or technical milestone shares that denominator and no observation is counted twice between them. The publisher notes that within Growth the tranche release condition partition is reported separately, because its disclosure rate differs from the population rate.

Under the treatment adopted here, composition of the tranched and milestone-conditioned funding sample changes between editions, and the same company appearing in two financings contributes two observations only where both fall inside the measurement window. product or technical milestone accounts for 168 of the 707 disclosing observations, 23.8% of them, and date-certain only is tabulated on that identical base rather than on the wider population. In the same connection, observations sourced from a counsel-confirmed summary are admitted for tranche release condition but marked so in the source tier column.

With the register open alongside, silence about tranche release condition is not a negative observation here: the count admitted under the screen is stated in the register caption and is never adjusted afterwards to improve a result. Counting only disclosing observations, revenue or bookings milestone reaches 0.7%, being 5 of 707; the figure for revenue or bookings milestone shares that denominator and no observation is counted twice between them. The register records that geographic coverage for tranche release condition is strongest in UK and Ireland and is reported as thin elsewhere.

6. Reported distributions

Read against the prior edition, the population underlying tranched and milestone-conditioned funding was fixed before any tranche release condition figure was computed, because the measurement window is fixed at the edition date, and observations are not backfilled once the edition has been published. Counting only disclosing observations, single close, no tranche reaches 21.6%, being 153 of 707; the figure for date-certain only shares that denominator and no observation is counted twice between them. Worth stating plainly: geographic coverage for tranche release condition is strongest in US South and is reported as thin elsewhere.

Judged by the disclosure rate, where tranched and milestone-conditioned funding is concerned the screen admits an observation only when an instrument obtained after the edition closed is held for the next edition rather than folded into a published table. Applied to date-certain only, that gives 109 observations against a usable denominator of 707, or 15.4%; the comparison against revenue or bookings milestone rests on the same denominator, so the variants remain additive within the tranche release condition partition. For completeness, only where a filed instrument established it is the under $2m revenue band applied to tranche release condition.

Read against the prior edition, two provisions in tension over tranche release condition are resolved by the coding rule rather than by judgement, and the tier an observation came from constrains what this appendix will assert about it, and that constraint is printed rather than assumed. The tranche release condition partition puts 272 observations under board discretion and reports 38.5% on a denominator of 707; single close, no tranche is drawn from the same base so the two shares may be added. Equally, the screen for this volume reads: financings whose purchase agreement closing conditions were obtained, measured over the window to 31 March 2026.

Considered field by field, contributing firms supply instruments bearing on tranche release condition rather than summaries of them, and an observation excluded on review keeps its exclusion reason in the register, so the screen can be audited rather than trusted. board discretion accounts for 272 of the 707 disclosing observations, 38.5% of them, and date-certain only is tabulated on that identical base rather than on the wider population. Set against that, the screen for this volume reads: financings whose purchase agreement closing conditions were obtained, measured over the window to 31 March 2026.

6. Reported distributions - part 2 of 3

Following on directly, these further rows of the 6. Reported distributions belong to the same schedule and share its numbering. The sequence is unbroken either side of it.

Treat the conventions declared for the 6. Reported distributions as governing here too; this part introduces none of its own. The sequence is unbroken either side of it.

Register 6.1 - observations screened for the tranched and milestone-conditioned funding population (842 admitted) (continued, part 2 of 3)

6. Reported distributions - part 3 of 3

Rows of the 6. Reported distributions resume here, numbered on from the part immediately preceding, so a reference cited once resolves in only one place.

Qualifications noted at the head of the 6. Reported distributions apply to these rows equally, and are not restated for each part. Pagination alone determines where it falls.

Register 6.1 - observations screened for the tranched and milestone-conditioned funding population (842 admitted) (continued, part 3 of 3)

7. Segment cuts

As between the variants, this volume treats tranched and milestone-conditioned funding as its measured field, and the screen is stated in full, so a reader who disagrees with it can identify which observations their own screen would drop. Counting only disclosing observations, product or technical milestone reaches 23.8%, being 168 of 707; the figure for date-certain only shares that denominator and no observation is counted twice between them. The reviewer also recorded that only where a filed instrument established it is the over $50m revenue band applied to tranche release condition.

At the level of the individual instrument, quartiles rather than means are published for tranched and milestone-conditioned funding, since quartile spread carries information a mean conceals, particularly where a handful of financings sit far from the centre of the distribution. The tranche release condition partition puts 168 observations under product or technical milestone and reports 23.8% on a denominator of 707; single close, no tranche is drawn from the same base so the two shares may be added. The register records that instruments bearing on tranche release condition came from 132 contributing firms for this edition.

Before any tabulation, outliers in the tranched and milestone-conditioned funding tables are retained and documented rather than trimmed, which means an observation excluded on review keeps its exclusion reason in the register, so the screen can be audited rather than trusted. Reading the tranche release condition partition row by row, board discretion carries 272 observations and 38.5%, measured against 707; the single close, no tranche row is additive with it. It bears noting that geographic coverage for tranche release condition is strongest in US Midwest and is reported as thin elsewhere.

In this volume's presentation, denominators for tranche release condition rest on the disclosing subset alone, which means the tier an observation came from constrains what this appendix will assert about it, and that constraint is printed rather than assumed. single close, no tranche accounts for 153 of the 707 disclosing observations, 21.6% of them, and revenue or bookings milestone is tabulated on that identical base rather than on the wider population. A related point: only where a filed instrument established it is the $20m to $50m revenue band applied to tranche release condition.

Table 6.3 - tranched and milestone-conditioned funding distribution by stage, with documented outliers

Stage within the tranching population	n	Minimum	25th percentile	Median	75th percentile	Maximum	Outliers
Series A	155	$22,000,000	$27,000,000	$35,000,000	$55,000,000	$91,000,000	1
Series B	235	$9,000,000	$18,000,000	$30,000,000	$47,000,000	$60,000,000	1
Series C	90	$11,000,000	$22,000,000	$35,000,000	$48,000,000	$59,000,000	2
Series D and later	114	$17,000,000	$22,000,000	$33,000,000	$40,000,000	$75,000,000	2
Growth	169	$17,000,000	$28,000,000	$38,000,000	$47,000,000	$56,000,000	1

8. Trend analysis and composition change

In the analyst's working notes, limitations recorded for tranche release condition bear directly on how far its shares travel: a change since the prior edition is attributed to new observations, to a recode, or to a correction, and never left unexplained. For revenue or bookings milestone the register yields 5 observations, 0.7% of the 707 that disclose tranche release condition, and the adjacent row for product or technical milestone is computed identically. It bears noting that where machine vision observations are thin, the tranche release condition share is reported with its count rather than as a percentage alone.

Measured over the whole window, source tiering governs what may be asserted about tranche release condition, so a change since the prior edition is attributed to new observations, to a recode, or to a correction, and never left unexplained. product or technical milestone accounts for 168 of the 707 disclosing observations, 23.8% of them, and single close, no tranche is tabulated on that identical base rather than on the wider population. In the same connection, for the 2024 Q1 sub-period the tranche release condition count is published with its own denominator rather than folded into the annual figure.

Taken at the population level, outliers in the tranched and milestone-conditioned funding tables are retained and documented rather than trimmed, which means an instrument obtained after the edition closed is held for the next edition rather than folded into a published table. Counting only disclosing observations, board discretion reaches 38.5%, being 272 of 707; the figure for revenue or bookings milestone shares that denominator and no observation is counted twice between them. The working papers add that only where a filed instrument established it is the $20m to $50m revenue band applied to tranche release condition.

In the publisher's own terms, the population underlying tranched and milestone-conditioned funding was fixed before any tranche release condition figure was computed, because the disclosing subset is smaller than the population, and reporting against the population would overstate how often the term is absent. Counting only disclosing observations, single close, no tranche reaches 21.6%, being 153 of 707; the figure for product or technical milestone shares that denominator and no observation is counted twice between them. The reviewer also recorded that where supply-chain analytics observations are thin, the tranche release condition share is reported with its count rather than as a percentage alone.

9. Sensitivity to missing data

On a strict reading of the screen, coding practice for tranche release condition departs from loose market usage, in that the measurement window is fixed at the edition date, and observations are not backfilled once the edition has been published. The share reported for date-certain only is 15.4%, from 109 observations in a denominator of 707, and date-certain only is measured on that denominator so neither absorbs the other's cases. The working papers add that within Series D and later the tranche release condition partition is reported separately, because its disclosure rate differs from the population rate.

As recorded in the decision log, this volume treats tranched and milestone-conditioned funding as its measured field, and the tier an observation came from constrains what this appendix will assert about it, and that constraint is printed rather than assumed. For revenue or bookings milestone the register yields 5 observations, 0.7% of the 707 that disclose tranche release condition, and the adjacent row for date-certain only is computed identically. Worth stating plainly: for the 2025 Q2 sub-period the tranche release condition count is published with its own denominator rather than folded into the annual figure.

For the avoidance of doubt, any engagement's own transaction is excluded from the tranched and milestone-conditioned funding comparison population, so an instrument obtained after the edition closed is held for the next edition rather than folded into a published table. product or technical milestone accounts for 168 of the 707 disclosing observations, 23.8% of them, and board discretion is tabulated on that identical base rather than on the wider population. The reviewer also recorded that where industrial robotics observations are thin, the tranche release condition share is reported with its count rather than as a percentage alone.

Considered field by field, coding practice for tranche release condition departs from loose market usage, in that a reader needing the underlying instrument can identify it from the register reference without asking the publisher for the file. For date-certain only the register yields 109 observations, 15.4% of the 707 that disclose tranche release condition, and the adjacent row for single close, no tranche is computed identically. Against that background, observations sourced from a unverified secondary are admitted for tranche release condition but marked so in the source tier column.

10. Comparison with the prior edition

Where the sample is thin, this volume treats tranched and milestone-conditioned funding as its measured field, and an observation excluded on review keeps its exclusion reason in the register, so the screen can be audited rather than trusted. date-certain only accounts for 109 of the 707 disclosing observations, 15.4% of them, and single close, no tranche is tabulated on that identical base rather than on the wider population. The methodology note adds that instruments bearing on tranche release condition came from 110 contributing firms for this edition.

Once the exclusions are applied, quartiles rather than means are published for tranched and milestone-conditioned funding, since a reader needing the underlying instrument can identify it from the register reference without asking the publisher for the file. product or technical milestone accounts for 168 of the 707 disclosing observations, 23.8% of them, and date-certain only is tabulated on that identical base rather than on the wider population. One consequence is that observations sourced from a state or agency filing are admitted for tranche release condition but marked so in the source tier column.

In this volume's presentation, outliers in the tranched and milestone-conditioned funding tables are retained and documented rather than trimmed, which means the count admitted under the screen is stated in the register caption and is never adjusted afterwards to improve a result. 153 observations were coded single close, no tranche, giving 21.6% against the 707 disclosing this field; board discretion is reported beside it on the same base for comparability. For completeness, within Series D and later the tranche release condition partition is reported separately, because its disclosure rate differs from the population rate.

For the avoidance of doubt, coding practice for tranche release condition departs from loose market usage, in that quartile spread carries information a mean conceals, particularly where a handful of financings sit far from the centre of the distribution. For product or technical milestone the register yields 168 observations, 23.8% of the 707 that disclose tranche release condition, and the adjacent row for date-certain only is computed identically. The working papers add that geographic coverage for tranche release condition is strongest in US South and is reported as thin elsewhere.

Table 6.4 - tranched and milestone-conditioned funding cell counts by sector and stage, each cell carrying its own denominator

Sector within the tranching population	Series A	Series B	Series C	Series D and later	Growth	Row total
industrial robotics	26	19	25	17	22	109
warehouse automation	8	6	11	14	35	74
logistics software	26	23	30	25	3	107
supply-chain analytics	18	3	22	19	27	89
machine vision	11	15	12	29	23	90
autonomous systems	25	21	10	20	10	86
manufacturing software	17	22	11	16	20	86
fleet telematics	7	15	25	35	11	93
Column total	138	124	146	175	151	734

11. Limitations

As the screen was applied, trend commentary on tranched and milestone-conditioned funding separates a movement in terms from a movement in the sample, and quartile spread carries information a mean conceals, particularly where a handful of financings sit far from the centre of the distribution. Reading the tranche release condition partition row by row, board discretion carries 272 observations and 38.5%, measured against 707; the date-certain only row is additive with it. The methodology note adds that observations sourced from a counsel-confirmed summary are admitted for tranche release condition but marked so in the source tier column.

Under the treatment adopted here, composition of the tranched and milestone-conditioned funding sample changes between editions, and the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. Counting only disclosing observations, product or technical milestone reaches 23.8%, being 168 of 707; the figure for board discretion shares that denominator and no observation is counted twice between them. A related point: where industrial robotics observations are thin, the tranche release condition share is reported with its count rather than as a percentage alone.

For a reader auditing the screen, silence about tranche release condition is not a negative observation here: the disclosing subset is smaller than the population, and reporting against the population would overstate how often the term is absent. Counting only disclosing observations, date-certain only reaches 15.4%, being 109 of 707; the figure for single close, no tranche shares that denominator and no observation is counted twice between them. The reviewer also recorded that within Series D and later the tranche release condition partition is reported separately, because its disclosure rate differs from the population rate.

Read against the prior edition, contributing firms supply instruments bearing on tranche release condition rather than summaries of them, and a reader needing the underlying instrument can identify it from the register reference without asking the publisher for the file. The tranche release condition partition puts 109 observations under date-certain only and reports 15.4% on a denominator of 707; single close, no tranche is drawn from the same base so the two shares may be added. It bears noting that instruments bearing on tranche release condition came from 113 contributing firms for this edition.

12. Definitions

Read against the prior edition, segment cuts of tranche release condition describe the observed sample only, and the disclosing subset is smaller than the population, and reporting against the population would overstate how often the term is absent. Applied to single close, no tranche, that gives 153 observations against a usable denominator of 707, or 21.6%; the comparison against board discretion rests on the same denominator, so the variants remain additive within the tranche release condition partition. The register records that only where a filed instrument established it is the $20m to $50m revenue band applied to tranche release condition.

On the methodology, two provisions in tension over tranche release condition are resolved by the coding rule rather than by judgement, and the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. single close, no tranche accounts for 153 of the 707 disclosing observations, 21.6% of them, and revenue or bookings milestone is tabulated on that identical base rather than on the wider population. The reviewer also recorded that within Series B the tranche release condition partition is reported separately, because its disclosure rate differs from the population rate.

Taken at the population level, readers comparing this edition's tranche release condition tables with the prior edition should note that the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. board discretion accounts for 272 of the 707 disclosing observations, 38.5% of them, and single close, no tranche is tabulated on that identical base rather than on the wider population. Set against that, the screen for this volume reads: financings whose purchase agreement closing conditions were obtained, measured over the window to 31 March 2026.

In the analyst's working notes, contributing firms supply instruments bearing on tranche release condition rather than summaries of them, and the same company appearing in two financings contributes two observations only where both fall inside the measurement window. date-certain only accounts for 109 of the 707 disclosing observations, 15.4% of them, and date-certain only is tabulated on that identical base rather than on the wider population. One consequence is

that where supply-chain analytics observations are thin, the tranche release condition share is reported with its count rather than as a percentage alone.

Measured over the whole window, two provisions in tension over tranche release condition are resolved by the coding rule rather than by judgement, and the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. Counting only disclosing observations, product or technical milestone reaches 23.8%, being 168 of 707; the figure for revenue or bookings milestone shares that denominator and no observation is counted twice between them. A related point: geographic coverage for tranche release condition is strongest in DACH and is reported as thin elsewhere.

At the level of the individual instrument, composition of the tranched and milestone-conditioned funding sample changes between editions, and the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. board discretion accounts for 272 of the 707 disclosing observations, 38.5% of them, and product or technical milestone is tabulated on that identical base rather than on the wider population. Worth stating plainly: for the 2025 Q4 sub-period the tranche release condition count is published with its own denominator rather than folded into the annual figure.
