MARKET SURVEY STATISTICAL APPENDIX - RECORD 007

Helioscope Robotics, Inc. - diligence file reference MARKET_APPENDICES-007

1. Research question and scope

Kessler Ward Research publishes this volume on pre-money valuation distributions alongside the term survey covering financings from 1 July 2023 to 31 March 2026. It asks how pre-money valuation is distributed by stage, sector and revenue band, over 1,212 admitted observations of which 860 disclose valuation disclosure basis. Observations were drawn from contributing firms and admitted where financings with a disclosed pre-money valuation and a classifiable revenue band.

At the level of the individual instrument, contributing firms supply instruments bearing on valuation disclosure basis rather than summaries of them, and the count admitted under the screen is stated in the register caption and is never adjusted afterwards to improve a result. The share reported for not disclosed is 38.0%, from 327 observations in a denominator of 860, and not disclosed is measured on that denominator so neither absorbs the other's cases. By the same token, geographic coverage for valuation disclosure basis is strongest in Canada and is reported as thin elsewhere.

As the screen was applied, any engagement's own transaction is excluded from the pre-money valuation distributions comparison population, so the published share and the composition-adjusted share appear side by side, and where they diverge the attribution column says which. The valuation disclosure basis partition puts 327 observations under not disclosed and reports 38.0% on a denominator of 860; not disclosed is drawn from the same base so the two shares may be added. For completeness, only where a filed instrument established it is the over $50m revenue band applied to valuation disclosure basis.

In the publisher's own terms, contributing firms supply instruments bearing on valuation disclosure basis rather than summaries of them, and a reader needing the underlying instrument can identify it from the register reference without asking the publisher for the file. Counting only disclosing observations, press report only reaches 34.2%, being 294 of 860; the figure for counsel confirmation shares that denominator and no observation is counted twice between them. By the same token, where machine vision observations are thin, the valuation disclosure basis share is reported with its count rather than as a percentage alone.

For the avoidance of doubt, an observation contributes to pre-money valuation distributions once only, and a term recorded as undisclosed is withheld from the denominator, the only treatment consistent with the disclosure rate printed beside it. press report only accounts for 294 of the 860 disclosing observations, 34.2% of them, and not disclosed is tabulated on that identical base rather than on the wider population. The methodology note adds that the screen for this volume reads: financings with a disclosed pre-money valuation and a classifiable revenue band, measured over the window to 31 March 2026.

Register 7.1 - observations screened for the pre-money valuation distributions population (1,212 admitted)

1. Research question and scope - part 2 of 3

Continuing the 1. Research question and scope, the rows below follow directly on from part 2 minus one, with no gap in the reference sequence. Pagination alone determines where it falls.

Everything stated about how the 1. Research question and scope was assembled continues to hold, and the break carries no substantive meaning. The sequence is unbroken either side of it.

Register 7.1 - observations screened for the pre-money valuation distributions population (1,212 admitted) (continued, part 2 of 3)

1. Research question and scope - part 3 of 3

Rows of the 1. Research question and scope resume here, numbered on from the part immediately preceding, so a reference cited once resolves in only one place. The break is editorial.

Qualifications noted at the head of the 1. Research question and scope apply to these rows equally, and are not restated for each part. Nothing is restated from the earlier part.

Register 7.1 - observations screened for the pre-money valuation distributions population (1,212 admitted) (continued, part 3 of 3)

2. Population definition and screen

As recorded in the decision log, segment cuts of valuation disclosure basis describe the observed sample only, and the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. For filed instrument the register yields 82 observations, 9.5% of the 860 that disclose valuation disclosure basis, and the adjacent row for filed instrument is computed identically. The methodology note adds that the screen for this volume reads: financings with a disclosed pre-money valuation and a classifiable revenue band, measured over the window to 31 March 2026.

In the analyst's working notes, source tiering governs what may be asserted about valuation disclosure basis, so the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. The share reported for not disclosed is 38.0%, from 327 observations in a denominator of 860, and filed instrument is measured on that denominator so neither absorbs the other's cases. Against that background, instruments bearing on valuation disclosure basis came from 111 contributing firms for this edition.

Taken at the population level, trend commentary on pre-money valuation distributions separates a movement in terms from a movement in the sample, and a change since the prior edition is attributed to new observations, to a recode, or to a correction, and never left unexplained. The share reported for press report only is 34.2%, from 294 observations in a denominator of 860, and filed instrument is measured on that denominator so neither absorbs the other's cases. A related point: instruments bearing on valuation disclosure basis came from 133 contributing firms for this edition.

For a reader auditing the screen, segment cuts of valuation disclosure basis describe the observed sample only, and a reader needing the underlying instrument can identify it from the register reference without asking the publisher for the file. Reading the valuation disclosure basis partition row by row, filed instrument carries 82 observations and 9.5%, measured against 860; the not disclosed row is additive with it. Set against that, the screen for this volume reads: financings with a disclosed pre-money valuation and a classifiable revenue band, measured over the window to 31 March 2026.

3. Source hierarchy and admissibility

As recorded in the decision log, quartiles rather than means are published for pre-money valuation distributions, since a reader needing the underlying instrument can identify it from the register reference without asking the publisher for the file. press report only accounts for 294 of the 860 disclosing observations, 34.2% of them, and not disclosed is tabulated on that identical base rather than on the wider population. As a practical matter, observations sourced from a unverified secondary are admitted for valuation disclosure basis but marked so in the source tier column.

As a matter of coding, silence about valuation disclosure basis is not a negative observation here: the measurement window is fixed at the edition date, and observations are not backfilled once the edition has been published. Counting only disclosing observations, press report only reaches 34.2%, being 294 of 860; the figure for press report only shares that denominator and no observation is counted twice between them. A related point: only where a filed instrument established it is the under $2m revenue band applied to valuation disclosure basis.

So far as disclosure permits, an observation contributes to pre-money valuation distributions once only, and the disclosing subset is smaller than the population, and reporting against the population would overstate how often the term is absent. The valuation disclosure basis partition puts 327 observations under not disclosed and reports 38.0% on a denominator of 860; counsel confirmation is drawn from the same base so the two shares may be added. As a practical matter, for the 2025 Q1 sub-period the valuation disclosure basis count is published with its own denominator rather than folded into the annual figure.

On the methodology, quartiles rather than means are published for pre-money valuation distributions, since the published share and the composition-adjusted share appear side by side, and where they diverge the attribution column says which. For not disclosed the register yields 327 observations, 38.0% of the 860 that disclose valuation disclosure basis, and the adjacent row for counsel confirmation is computed identically. One consequence is that geographic coverage for valuation disclosure basis is strongest in Canada and is reported as thin elsewhere.

4. Coding rules for ambiguous instruments

As the screen was applied, an analyst recoding a valuation disclosure basis observation must record the alternative, because a term recorded as undisclosed is withheld from the denominator, the only treatment consistent with the disclosure rate printed beside it. Applied to press report only, that gives 294 observations against a usable denominator of 860, or 34.2%; the comparison against press report only rests on the same denominator, so the variants remain additive within the valuation disclosure basis partition. It bears noting that within Series A the valuation disclosure basis partition is reported separately, because its disclosure rate differs from the population rate.

At the level of the individual instrument, limitations recorded for valuation disclosure basis bear directly on how far its shares travel: the tier an observation came from constrains what this appendix will assert about it, and that constraint is printed rather than assumed. The valuation disclosure basis partition puts 82 observations under filed instrument and reports 9.5% on a denominator of 860; not disclosed is drawn from the same base so the two shares may be added. On the same evidence, the screen for this volume reads: financings with a disclosed pre-money valuation and a classifiable revenue band, measured over the window to 31 March 2026.

Put in terms of denominators, two provisions in tension over valuation disclosure basis are resolved by the coding rule rather than by judgement, and the disclosing subset is smaller than the population, and reporting against the population would overstate how often the term is absent. Applied to filed instrument, that gives 82 observations against a usable denominator of 860, or 9.5%; the comparison against filed instrument rests on the same denominator, so the variants remain additive within the valuation disclosure basis partition. The working papers add that for the 2026 Q2 sub-period the valuation disclosure basis count is published with its own denominator rather than folded into the annual figure.

Against the source hierarchy, silence about valuation disclosure basis is not a negative observation here: the measurement window is fixed at the edition date, and observations are not backfilled once the edition has been published. The share reported for press report only is 34.2%, from 294 observations in a denominator of 860, and filed instrument is measured on that denominator so neither absorbs the other's cases. Set against that, observations sourced from a contemporaneous press report are admitted for valuation disclosure basis but marked so in the source tier column.

Table 7.2 - valuation disclosure basis frequency on a usable denominator of 860

Valuation disclosure basis	Observations	Usable denominator	Share of usable	Prior edition share	Movement
filed instrument	82	860	9.5%	22.0%	-12.4 pp
counsel confirmation	157	860	18.3%	25.8%	-7.6 pp
press report only	294	860	34.2%	40.5%	-6.3 pp
not disclosed	327	860	38.0%	11.7%	+26.3 pp
not disclosed (excluded from denominator)	352	1,212	29.0%	-	-

5. Disclosure treatment and denominators

The screen for pre-money valuation distributions admits 1,212 observations, of which 352 say nothing about valuation disclosure basis, a disclosure rate of 71.0%. No table in this volume divides by 1,212. Doing so would credit the silent observations with an absence of valuation disclosure basis that no instrument supports.

In the analyst's working notes, composition of the pre-money valuation distributions sample changes between editions, and the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. filed instrument accounts for 82 of the 860 disclosing observations, 9.5% of them, and press report only is tabulated on that identical base rather than on the wider population. Set against that, within Series C the valuation disclosure basis partition is reported separately, because its disclosure rate differs from the population rate.

In the analyst's working notes, readers comparing this edition's valuation disclosure basis tables with the prior edition should note that the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. Applied to press report only, that gives 294 observations against a usable denominator of 860, or 34.2%; the comparison against filed instrument rests on the same denominator, so the variants remain additive within the valuation disclosure basis partition. The publisher notes that geographic coverage for valuation disclosure basis is strongest in US Midwest and is reported as thin elsewhere.

Before any tabulation, silence about valuation disclosure basis is not a negative observation here: the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. The valuation disclosure basis partition puts 327 observations under not disclosed and reports 38.0% on a denominator of 860; counsel confirmation is drawn from the same base so the two shares may be added. A qualification applies here: observations sourced from a unverified secondary are admitted for valuation disclosure basis but marked so in the source tier column.

Measured over the whole window, an analyst recoding a valuation disclosure basis observation must record the alternative, because quartile spread carries information a mean conceals, particularly where a handful of financings sit far from the centre of the distribution. Counting only disclosing observations, press report only reaches 34.2%, being 294 of 860; the figure for press report only shares that denominator and no observation is counted twice between them. In the same connection, within Series A the valuation disclosure basis partition is reported separately, because its disclosure rate differs from the population rate.

6. Reported distributions

By way of scope, contributing firms supply instruments bearing on valuation disclosure basis rather than summaries of them, and no figure here rests on a single unverified secondary source without that being visible in the source tier column. For press report only the register yields 294 observations, 34.2% of the 860 that disclose valuation disclosure basis, and the adjacent row for counsel confirmation is computed identically. By the same token, instruments bearing on valuation disclosure basis came from 123 contributing firms for this edition.

For the avoidance of doubt, research design for valuation disclosure basis begins from the population rather than the tabulation, because an instrument obtained after the edition closed is held for the next edition rather than folded into a published table. For not disclosed the register yields 327 observations, 38.0% of the 860 that disclose valuation disclosure basis, and the adjacent row for press report only is computed identically. The publisher notes that where supply-chain analytics observations are thin, the valuation disclosure basis share is reported with its count rather than as a percentage alone.

Considered field by field, segment cuts of valuation disclosure basis describe the observed sample only, and the measurement window is fixed at the edition date, and observations are not backfilled once the edition has been published. Counting only disclosing observations, counsel confirmation reaches 18.3%, being 157 of 860; the figure for counsel confirmation shares that denominator and no observation is counted twice between them. The register records that observations sourced from a unverified secondary are admitted for valuation disclosure basis but marked so in the source tier column.

For a reader auditing the screen, source tiering governs what may be asserted about valuation disclosure basis, so the disclosing subset is smaller than the population, and reporting against the population would overstate how often the term is absent. 82 observations were coded filed instrument, giving 9.5% against the 860 disclosing this field; press report only is reported beside it on the same base for comparability. The publisher notes that geographic coverage for valuation disclosure basis is strongest in DACH and is reported as thin elsewhere.

6. Reported distributions - part 2 of 3

This is part 2 of the 6. Reported distributions, carried over unbroken; a reader reconciling a reference should treat the parts as a single register.

Everything stated about how the 6. Reported distributions was assembled continues to hold, and the break carries no substantive meaning. Nothing is restated from the earlier part.

Register 7.1 - observations screened for the pre-money valuation distributions population (1,212 admitted) (continued, part 2 of 3)

6. Reported distributions - part 3 of 3

Because the 6. Reported distributions does not fit one page, its remainder is set out below under the same references. No row is omitted at the join.

Nothing in this part varies how the 6. Reported distributions was compiled, and the headings given at the start remain the operative ones. Pagination alone determines where it falls.

Register 7.1 - observations screened for the pre-money valuation distributions population (1,212 admitted) (continued, part 3 of 3)

7. Segment cuts

On a strict reading of the screen, sensitivity analysis reruns each valuation disclosure basis share under alternative treatments, and an observation excluded on review keeps its exclusion reason in the register, so the screen can be audited rather than trusted. 294 observations were coded press report only, giving 34.2% against the 860 disclosing this field; filed instrument is reported beside it on the same base for comparability. Equally, for the 2026 Q2 sub-period the valuation disclosure basis count is published with its own denominator rather than folded into the annual figure.

With the register open alongside, limitations recorded for valuation disclosure basis bear directly on how far its shares travel: the count admitted under the screen is stated in the register caption and is never adjusted afterwards to improve a result. The valuation disclosure basis partition puts 294 observations under press report only and reports 34.2% on a denominator of 860; not disclosed is drawn from the same base so the two shares may be added. The reviewer also recorded that within Series B the valuation disclosure basis partition is reported separately, because its disclosure rate differs from the population rate.

So far as disclosure permits, segment cuts of valuation disclosure basis describe the observed sample only, and the same company appearing in two financings contributes two observations only where both fall inside the measurement window. Applied to press report only, that gives 294 observations against a usable denominator of 860, or 34.2%; the comparison against filed instrument rests on the same denominator, so the variants remain additive within the valuation disclosure basis partition. By the same token, within Series B the valuation disclosure basis partition is reported separately, because its disclosure rate differs from the population rate.

Against the source hierarchy, outliers in the pre-money valuation distributions tables are retained and documented rather than trimmed, which means the screen is stated in full, so a reader who disagrees with it can identify which observations their own screen would drop. Reading the valuation disclosure basis partition row by row, counsel confirmation carries 157 observations and 18.3%, measured against 860; the filed instrument row is additive with it. On

the same evidence, for the 2023 Q1 sub-period the valuation disclosure basis count is published with its own denominator rather than folded into the annual figure.

Table 7.9 - movement in valuation disclosure basis against the prior edition, by cause

Valuation disclosure basis movement	Prior edition	This edition	Underlying change	Attributed cause
filed instrument	62.5%	31.1%	75 new observations	recode of two observations
counsel confirmation	44.3%	21.1%	17 new observations	correction to a prior edition
press report only	40.3%	38.6%	35 new observations	new observations only
not disclosed	53.5%	41.6%	77 new observations	new observations only

8. Trend analysis and composition change

In the publisher's own terms, the population underlying pre-money valuation distributions was fixed before any valuation disclosure basis figure was computed, because the published share and the composition-adjusted share appear side by side, and where they diverge the attribution column says which. Reading the valuation disclosure basis partition row by row, not disclosed carries 327 observations and 38.0%, measured against 860; the filed instrument row is additive with it. Equally, observations sourced from a unverified secondary are admitted for valuation disclosure basis but marked so in the source tier column.

Against the source hierarchy, composition of the pre-money valuation distributions sample changes between editions, and an observation excluded on review keeps its exclusion reason in the register, so the screen can be audited rather than trusted. For counsel confirmation the register yields 157 observations, 18.3% of the 860 that disclose valuation disclosure basis, and the adjacent row for not disclosed is computed identically. A qualification applies here: for the 2025 Q3 sub-period the valuation disclosure basis count is published with its own denominator rather than folded into the annual figure.

So far as disclosure permits, this volume treats pre-money valuation distributions as its measured field, and the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. Counting only disclosing observations, press report only reaches 34.2%, being 294 of 860; the figure for not disclosed shares that denominator and no observation is counted twice between them. Against that background, only where a filed instrument established it is the over $50m revenue band applied to valuation disclosure basis.

By way of scope, the population underlying pre-money valuation distributions was fixed before any valuation disclosure basis figure was computed, because the disclosing subset is smaller than the population, and reporting against the population would overstate how often the term is absent. 82 observations were coded filed instrument, giving 9.5% against the 860 disclosing this field; press report only is reported beside it on the same base for comparability. The working papers add that the screen for this volume reads: financings with a disclosed pre-money valuation and a classifiable revenue band, measured over the window to 31 March 2026.

9. Sensitivity to missing data

Considered field by field, trend commentary on pre-money valuation distributions separates a movement in terms from a movement in the sample, and the disclosing subset is smaller than the population, and reporting against the population would overstate how often the term is absent. The valuation disclosure basis partition puts 157 observations under counsel confirmation and reports 18.3% on a denominator of 860; filed instrument is drawn from the same base so the two shares may be added. Equally, observations sourced from a executed instrument are admitted for valuation disclosure basis but marked so in the source tier column.

Once the exclusions are applied, where pre-money valuation distributions is concerned the screen admits an observation only when the count admitted under the screen is stated in the register caption and is never adjusted afterwards to improve a result. The valuation disclosure basis partition puts 327 observations under not disclosed and reports 38.0% on a denominator of 860; filed instrument is drawn from the same base so the two shares may be added. The working papers add that geographic coverage for valuation disclosure basis is strongest in DACH and is reported as thin elsewhere.

Put in terms of denominators, research design for valuation disclosure basis begins from the population rather than the tabulation, because a term recorded as undisclosed is withheld from the denominator, the only treatment consistent with the disclosure rate printed beside it. 294 observations were coded press report only, giving 34.2% against the 860 disclosing this field; counsel confirmation is reported beside it on the same base for comparability. For completeness, where logistics software observations are thin, the valuation disclosure basis share is reported with its count rather than as a percentage alone.

Measured over the whole window, coding practice for valuation disclosure basis departs from loose market usage, in that quartile spread carries information a mean conceals, particularly where a handful of financings sit far from the centre of the distribution. filed instrument accounts for 82 of the 860 disclosing observations, 9.5% of them, and press report only is tabulated on that identical base rather than on the wider population. By the same token, where manufacturing software observations are thin, the valuation disclosure basis share is reported with its count rather than as a percentage alone.

10. Comparison with the prior edition

Put in terms of denominators, limitations recorded for valuation disclosure basis bear directly on how far its shares travel: the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. For press report only the register yields 294 observations, 34.2% of the 860 that disclose valuation disclosure basis, and the adjacent row for not disclosed is computed identically. Set against that, geographic coverage for valuation disclosure basis is strongest in Canada and is reported as thin elsewhere.

As between the variants, an observation contributes to pre-money valuation distributions once only, and no figure here rests on a single unverified secondary source without that being visible in the source tier column. Reading the valuation disclosure basis partition row by row, counsel confirmation carries 157 observations and 18.3%, measured against 860; the counsel confirmation row is additive with it. For completeness, geographic coverage for valuation disclosure basis is strongest in US Northeast and is reported as thin elsewhere.

Looking across the window, any engagement's own transaction is excluded from the pre-money valuation distributions comparison population, so the published share and the composition-adjusted share appear side by side, and where they diverge the attribution column says which. 157 observations were coded counsel confirmation, giving 18.3% against the 860 disclosing this field; press report only is reported beside it on the same base for comparability. Set against that, only where a filed instrument established it is the $20m to $50m revenue band applied to valuation disclosure basis.

Taken at the population level, sensitivity analysis reruns each valuation disclosure basis share under alternative treatments, and the screen is stated in full, so a reader who disagrees with it can identify which observations their own screen would drop. For filed instrument the register yields 82 observations, 9.5% of the 860 that disclose valuation disclosure basis, and the adjacent row for press report only is computed identically. On the same evidence, geographic coverage for valuation disclosure basis is strongest in Canada and is reported as thin elsewhere.

Table 7.3 - pre-money valuation distributions distribution by stage, with documented outliers

Stage within the valuation population	n	Minimum	25th percentile	Median	75th percentile	Maximum	Outliers
Series A	171	$10,000,000	$15,000,000	$28,000,000	$43,000,000	$52,000,000	1
Series B	248	$9,000,000	$15,000,000	$28,000,000	$36,000,000	$63,000,000	0
Series C	167	$27,000,000	$35,000,000	$45,000,000	$52,000,000	$65,000,000	1
Series D and later	121	$26,000,000	$35,000,000	$45,000,000	$50,000,000	$66,000,000	0
Growth	174	$21,000,000	$32,000,000	$41,000,000	$52,000,000	$63,000,000	1

11. Limitations

Measured over the whole window, where pre-money valuation distributions is concerned the screen admits an observation only when an instrument obtained after the edition closed is held for the next edition rather than folded into a published table. Counting only disclosing observations, press report only reaches 34.2%, being 294 of 860; the figure for counsel confirmation shares that denominator and no observation is counted twice between them. Set against that, geographic coverage for valuation disclosure basis is strongest in US Northeast and is reported as thin elsewhere.

At the level of the individual instrument, the population underlying pre-money valuation distributions was fixed before any valuation disclosure basis figure was computed, because an instrument obtained after the edition closed is held for the next edition rather than folded into a published table. filed instrument accounts for 82 of the 860 disclosing observations, 9.5% of them, and filed instrument is tabulated on that identical base rather than on the wider population. The composition tables show that geographic coverage for valuation disclosure basis is strongest in Nordics and is reported as thin elsewhere.

Measured over the whole window, denominators for valuation disclosure basis rest on the disclosing subset alone, which means an instrument obtained after the edition closed is held for the next edition rather than folded into a published table. For counsel confirmation the register yields 157 observations, 18.3% of the 860 that disclose valuation disclosure basis, and the adjacent row for press report only is computed identically. The methodology note adds that geographic coverage for valuation disclosure basis is strongest in US Midwest and is reported as thin elsewhere.

Set beside the composition tables, sensitivity analysis reruns each valuation disclosure basis share under alternative treatments, and no figure here rests on a single unverified secondary source without that being visible in the source tier column. Reading the valuation disclosure basis partition row by row, press report only carries 294 observations and 34.2%, measured against 860; the filed instrument row is additive with it. For completeness, for the 2025 Q4 sub-period the valuation disclosure basis count is published with its own denominator rather than folded into the annual figure.

12. Definitions

Under the treatment adopted here, where pre-money valuation distributions is concerned the screen admits an observation only when no figure here rests on a single unverified secondary source without that being visible in the source tier column. Reading the valuation disclosure basis partition row by row, not disclosed carries 327 observations and 38.0%, measured against 860; the filed instrument row is additive with it. The composition tables show that only where a filed instrument established it is the $2m to $8m revenue band applied to valuation disclosure basis.

Judged by the disclosure rate, because instruments disclose valuation disclosure basis unevenly, the published share and the composition-adjusted share appear side by side, and where they diverge the attribution column says which. For filed instrument the register yields 82 observations, 9.5% of the 860 that disclose valuation disclosure basis, and the adjacent row for press report only is computed identically. A related point: only where a filed instrument established it is the $2m to $8m revenue band applied to valuation disclosure basis.

Read against the prior edition, an observation contributes to pre-money valuation distributions once only, and the disclosing subset is smaller than the population, and reporting against the population would overstate how often the term is absent. Reading the valuation disclosure basis partition row by row, filed instrument carries 82 observations and 9.5%, measured against 860; the not disclosed row is additive with it. By the same token, observations sourced from a contemporaneous press report are admitted for valuation disclosure basis but marked so in the source tier column.

Looking across the window, contributing firms supply instruments bearing on valuation disclosure basis rather than summaries of them, and an instrument obtained after the edition closed is held for the next edition rather than folded into a published table. Counting only disclosing observations, filed instrument reaches 9.5%, being 82 of 860; the figure for not disclosed shares that denominator and no observation is counted twice between them. On the same evidence, observations sourced from a counsel-confirmed summary are admitted for valuation disclosure basis but marked so in the source tier column.
