MARKET SURVEY STATISTICAL APPENDIX - RECORD 008

Helioscope Robotics, Inc. - diligence file reference MARKET_APPENDICES-008

1. Research question and scope

Kessler Ward Research publishes this volume on round size and primary dilution alongside the term survey covering financings from 1 July 2023 to 31 March 2026. It asks how much is raised and how much ownership the round transfers, over 1,152 admitted observations of which 1,013 disclose round size disclosure. Observations were drawn from contributing firms and admitted where financings with a disclosed aggregate commitment.

Against the source hierarchy, segment cuts of round size disclosure describe the observed sample only, and no figure here rests on a single unverified secondary source without that being visible in the source tier column. Counting only disclosing observations, range disclosed reaches 6.1%, being 62 of 1,013; the figure for full amount disclosed shares that denominator and no observation is counted twice between them. In the same connection, for the 2023 Q4 sub-period the round size disclosure count is published with its own denominator rather than folded into the annual figure.

As a matter of coding, quartiles rather than means are published for round size and primary dilution, since a term recorded as undisclosed is withheld from the denominator, the only treatment consistent with the disclosure rate printed beside it. Applied to not disclosed, that gives 273 observations against a usable denominator of 1,013, or 26.9%; the comparison against initial tranche only rests on the same denominator, so the variants remain additive within the round size disclosure partition. It bears noting that the screen for this volume reads: financings with a disclosed aggregate commitment, measured over the window to 31 March 2026.

Under the treatment adopted here, readers comparing this edition's round size disclosure tables with the prior edition should note that a term recorded as undisclosed is withheld from the denominator, the only treatment consistent with the disclosure rate printed beside it. Counting only disclosing observations, initial tranche only reaches 33.5%, being 339 of 1,013; the figure for range disclosed shares that denominator and no observation is counted twice between them. Against that background, geographic coverage for round size disclosure is strongest in US Northeast and is reported as thin elsewhere.

At the level of the individual instrument, trend commentary on round size and primary dilution separates a movement in terms from a movement in the sample, and an observation excluded on review keeps its exclusion reason in the register, so the screen can be audited rather than trusted. The round size disclosure partition puts 62 observations under range disclosed and reports 6.1% on a denominator of 1,013; not disclosed is drawn from the same base so the two shares may be added. In the same connection, only where a filed instrument established it is the $2m to $8m revenue band applied to round size disclosure.

Register 8.1 - observations screened for the round size and primary dilution population (1,152 admitted)

1. Research question and scope - part 2 of 3

Presentation of the 1. Research question and scope carries on below without restarting the row numbers, the break being one of pagination only. No row is omitted at the join.

Treat the conventions declared for the 1. Research question and scope as governing here too; this part introduces none of its own. Nothing is restated from the earlier part.

Register 8.1 - observations screened for the round size and primary dilution population (1,152 admitted) (continued, part 2 of 3)

1. Research question and scope - part 3 of 3

Following on directly, these further rows of the 1. Research question and scope belong to the same schedule and share its numbering. Nothing is restated from the earlier part.

The measurement basis recorded when the 1. Research question and scope opened is unchanged, so any figure here is comparable with any figure in the earlier parts. The parts are to be read together.

Register 8.1 - observations screened for the round size and primary dilution population (1,152 admitted) (continued, part 3 of 3)

2. Population definition and screen

As recorded in the decision log, field-level disclosure rates for round size disclosure are published beside every share, so the tier an observation came from constrains what this appendix will assert about it, and that constraint is printed rather than assumed. 339 observations were coded full amount disclosed, giving 33.5% against the 1,013 disclosing this field; initial tranche only is reported beside it on the same base for comparability. It follows that observations sourced from a contemporaneous press report are admitted for round size disclosure but marked so in the source tier column.

On the methodology, research design for round size disclosure begins from the population rather than the tabulation, because the tier an observation came from constrains what this appendix will assert about it, and that constraint is printed rather than assumed. range disclosed accounts for 62 of the 1,013 disclosing observations, 6.1% of them, and range disclosed is tabulated on that identical base rather than on the wider population. One consequence is that the screen for this volume reads: financings with a disclosed aggregate commitment, measured over the window to 31 March 2026.

In the publisher's own terms, composition of the round size and primary dilution sample changes between editions, and the same company appearing in two financings contributes two observations only where both fall inside the measurement window. full amount disclosed accounts for 339 of the 1,013 disclosing observations, 33.5% of them, and not disclosed is tabulated on that identical base rather than on the wider population. It bears noting that instruments bearing on round size disclosure came from 111 contributing firms for this edition.

So far as disclosure permits, any engagement's own transaction is excluded from the round size and primary dilution comparison population, so the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. initial tranche only accounts for 339 of the 1,013 disclosing observations, 33.5% of them, and initial tranche only is tabulated on that identical base rather than on the wider population. As a practical matter, geographic coverage for round size disclosure is strongest in US Northeast and is reported as thin elsewhere.

3. Source hierarchy and admissibility

Turning to the register, silence about round size disclosure is not a negative observation here: the disclosing subset is smaller than the population, and reporting against the population would overstate how often the term is absent. 62 observations were coded range disclosed, giving 6.1% against the 1,013 disclosing this field; range disclosed is reported beside it on the same base for comparability. Set against that, where manufacturing software observations are thin, the round size disclosure share is reported with its count rather than as a percentage alone.

Read against the prior edition, segment cuts of round size disclosure describe the observed sample only, and no figure here rests on a single unverified secondary source without that being visible in the source tier column. Applied to initial tranche only, that gives 339 observations against a usable denominator of 1,013, or 33.5%; the comparison against initial tranche only rests on the same denominator, so the variants remain additive within the round size disclosure partition. The methodology note adds that for the 2023 Q4 sub-period the round size disclosure count is published with its own denominator rather than folded into the annual figure.

Framed as a research question, sensitivity analysis reruns each round size disclosure share under alternative treatments, and the same company appearing in two financings contributes two observations only where both fall inside the measurement window. initial tranche only accounts for 339 of the 1,013 disclosing observations, 33.5% of them, and not disclosed is tabulated on that identical base rather than on the wider population. Equally, the screen for this volume reads: financings with a disclosed aggregate commitment, measured over the window to 31 March 2026.

Put in terms of denominators, because instruments disclose round size disclosure unevenly, a change since the prior edition is attributed to new observations, to a recode, or to a correction, and never left unexplained. For full amount disclosed the register yields 339 observations, 33.5% of the 1,013 that disclose round size disclosure, and the adjacent row for full amount disclosed is computed identically. The working papers add that where fleet telematics observations are thin, the round size disclosure share is reported with its count rather than as a percentage alone.

4. Coding rules for ambiguous instruments

Considered field by field, because instruments disclose round size disclosure unevenly, the measurement window is fixed at the edition date, and observations are not backfilled once the edition has been published. For full amount disclosed the register yields 339 observations, 33.5% of the 1,013 that disclose round size disclosure, and the adjacent row for full amount disclosed is computed identically. The working papers add that instruments bearing on round size disclosure came from 138 contributing firms for this edition.

For a reader auditing the screen, because instruments disclose round size disclosure unevenly, the measurement window is fixed at the edition date, and observations are not backfilled once the edition has been published. not disclosed accounts for 273 of the 1,013 disclosing observations, 26.9% of them, and not disclosed is tabulated on that identical base rather than on the wider population. The register records that instruments bearing on round size disclosure came from 109 contributing firms for this edition.

For a reader auditing the screen, segment cuts of round size disclosure describe the observed sample only, and the published share and the composition-adjusted share appear side by side, and where they diverge the attribution column says which. Reading the round size disclosure partition row by row, initial tranche only carries 339 observations and 33.5%, measured against 1,013; the full amount disclosed row is additive with it. The composition tables show that where manufacturing software observations are thin, the round size disclosure share is reported with its count rather than as a percentage alone.

Under the treatment adopted here, quartiles rather than means are published for round size and primary dilution, since no figure here rests on a single unverified secondary source without that being visible in the source tier column. Counting only disclosing observations, not disclosed reaches 26.9%, being 273 of 1,013; the figure for full amount disclosed shares that denominator and no observation is counted twice between them. As a practical matter, only where a filed instrument established it is the $8m to $20m revenue band applied to round size disclosure.

Table 8.2 - round size disclosure frequency on a usable denominator of 1,013

Round size disclosure	Observations	Usable denominator	Share of usable	Prior edition share	Movement
full amount disclosed	339	1,013	33.5%	13.7%	+19.7 pp
initial tranche only	339	1,013	33.5%	27.5%	+5.9 pp
range disclosed	62	1,013	6.1%	28.8%	-22.7 pp
not disclosed	273	1,013	26.9%	29.9%	-3.0 pp
not disclosed (excluded from denominator)	139	1,152	12.1%	-	-

5. Disclosure treatment and denominators

Of the 1,152 observations admitted for round size and primary dilution, 1,013 disclose round size disclosure and 139 do not, a disclosure rate of 87.9%. Shares for round size disclosure are therefore computed on 1,013; treating the silent observations as though the term were absent would understate how often it is taken.

Measured over the whole window, outliers in the round size and primary dilution tables are retained and documented rather than trimmed, which means the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. For full amount disclosed the register yields 339

observations, 33.5% of the 1,013 that disclose round size disclosure, and the adjacent row for initial tranche only is computed identically. Against that background, instruments bearing on round size disclosure came from 120 contributing firms for this edition.

Set beside the composition tables, contributing firms supply instruments bearing on round size disclosure rather than summaries of them, and the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. The round size disclosure partition puts 339 observations under initial tranche only and reports 33.5% on a denominator of 1,013; range disclosed is drawn from the same base so the two shares may be added. The working papers add that instruments bearing on round size disclosure came from 123 contributing firms for this edition.

By way of scope, definitions governing round size disclosure are stated before any figure is reported, since a change since the prior edition is attributed to new observations, to a recode, or to a correction, and never left unexplained. Applied to full amount disclosed, that gives 339 observations against a usable denominator of 1,013, or 33.5%; the comparison against initial tranche only rests on the same denominator, so the variants remain additive within the round size disclosure partition. By the same token, instruments bearing on round size disclosure came from 126 contributing firms for this edition.

Taken at the population level, an observation contributes to round size and primary dilution once only, and the disclosing subset is smaller than the population, and reporting against the population would overstate how often the term is absent. For initial tranche only the register yields 339 observations, 33.5% of the 1,013 that disclose round size disclosure, and the adjacent row for full amount disclosed is computed identically. The composition tables show that observations sourced from a contemporaneous press report are admitted for round size disclosure but marked so in the source tier column.

6. Reported distributions

As a matter of coding, coding practice for round size disclosure departs from loose market usage, in that the count admitted under the screen is stated in the register caption and is never adjusted afterwards to improve a result. The round size disclosure partition puts 339 observations under full amount disclosed and reports 33.5% on a denominator of 1,013; full amount disclosed is drawn from the same base so the two shares may be added. Worth stating plainly: geographic coverage for round size disclosure is strongest in DACH and is reported as thin elsewhere.

Turning to the register, limitations recorded for round size disclosure bear directly on how far its shares travel: the count admitted under the screen is stated in the register caption and is never adjusted afterwards to improve a result. Applied to range disclosed, that gives 62 observations against a usable denominator of 1,013, or 6.1%; the comparison against full amount disclosed rests on the same denominator, so the variants remain additive within the round size disclosure partition. The register records that only where a filed instrument established it is the $20m to $50m revenue band applied to round size disclosure.

For the avoidance of doubt, silence about round size disclosure is not a negative observation here: the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. Counting only disclosing observations, full amount disclosed reaches 33.5%, being 339 of 1,013; the figure for full amount disclosed shares that denominator and no observation is counted twice between them. The register records that within Series B the round size disclosure partition is reported separately, because its disclosure rate differs from the population rate.

At the level of the individual instrument, research design for round size disclosure begins from the population rather than the tabulation, because no figure here rests on a single unverified secondary source without that being visible in the source tier column. 339 observations were coded initial tranche only, giving 33.5% against the 1,013 disclosing this field; not disclosed is reported beside it on the same base for comparability. The register records that instruments bearing on round size disclosure came from 138 contributing firms for this edition.

6. Reported distributions - part 2 of 3

Below, the 6. Reported distributions continues; nothing separates this part from the last except the page on which it happens to fall. The parts are to be read together.

Readers should carry the 6. Reported distributions's stated conventions across the break, since this part adds no definition of its own. The sequence is unbroken either side of it.

Register 8.1 - observations screened for the round size and primary dilution population (1,152 admitted) (continued, part 2 of 3)

7. Segment cuts

For the avoidance of doubt, research design for round size disclosure begins from the population rather than the tabulation, because the screen is stated in full, so a reader who disagrees with it can identify which observations their own screen would drop. For range disclosed the register yields 62 observations, 6.1% of the 1,013 that disclose round size disclosure, and the adjacent row for range disclosed is computed identically. The composition tables show that the screen for this volume reads: financings with a disclosed aggregate commitment, measured over the window to 31 March 2026.

So far as disclosure permits, an observation contributes to round size and primary dilution once only, and the disclosing subset is smaller than the population, and reporting against the population would overstate how often the term is absent. For initial tranche only the register yields 339 observations, 33.5% of the 1,013 that disclose round size disclosure, and the adjacent row for full amount disclosed is computed identically. Against that background, geographic coverage for round size disclosure is strongest in DACH and is reported as thin elsewhere.

Taken at the population level, trend commentary on round size and primary dilution separates a movement in terms from a movement in the sample, and the tier an observation came from constrains what this appendix will assert about it, and that constraint is printed rather than assumed. For range disclosed the register yields 62 observations, 6.1% of the 1,013 that disclose round size disclosure, and the adjacent row for range disclosed is computed identically. The methodology note adds that for the 2023 Q2 sub-period the round size disclosure count is published with its own denominator rather than folded into the annual figure.

Framed as a research question, coding practice for round size disclosure departs from loose market usage, in that the tier an observation came from constrains what this appendix will assert about it, and that constraint is printed rather than assumed. Applied to not disclosed, that gives 273 observations against a usable denominator of 1,013, or 26.9%; the comparison against range disclosed rests on the same denominator, so the variants remain additive within the round size

disclosure partition. For completeness, instruments bearing on round size disclosure came from 130 contributing firms for this edition.

Table 8.3 - round size and primary dilution distribution by stage, with documented outliers

Stage within the round_size population	n	Minimum	25th percentile	Median	75th percentile	Maximum	Outliers
Series A	160	$13,000,000	$23,000,000	$27,000,000	$47,000,000	$90,000,000	2
Series B	136	$25,000,000	$30,000,000	$41,000,000	$51,000,000	$88,000,000	0
Series C	92	$23,000,000	$31,000,000	$41,000,000	$50,000,000	$93,000,000	2
Series D and later	108	$29,000,000	$36,000,000	$49,000,000	$56,000,000	$75,000,000	1
Growth	130	$25,000,000	$33,000,000	$39,000,000	$56,000,000	$63,000,000	0

8. Trend analysis and composition change

As a matter of coding, this volume treats round size and primary dilution as its measured field, and no figure here rests on a single unverified secondary source without that being visible in the source tier column. Counting only disclosing observations, range disclosed reaches 6.1%, being 62 of 1,013; the figure for not disclosed shares that denominator and no observation is counted twice between them. The reviewer also recorded that only where a filed instrument established it is the over $50m revenue band applied to round size disclosure.

Framed as a research question, where round size and primary dilution is concerned the screen admits an observation only when a term recorded as undisclosed is withheld from the denominator, the only treatment consistent with the disclosure rate printed beside it. Counting only disclosing observations, not disclosed reaches 26.9%, being 273 of 1,013; the figure for full amount disclosed shares that denominator and no observation is counted twice between them. As a practical matter, only where a filed instrument established it is the under $2m revenue band applied to round size disclosure.

With the register open alongside, an analyst recoding a round size disclosure observation must record the alternative, because the tier an observation came from constrains what this appendix will assert about it, and that constraint is printed rather than assumed. Reading the round size disclosure partition row by row, range disclosed carries 62 observations and 6.1%, measured against 1,013; the full amount disclosed row is additive with it. The publisher notes that within Series D and later the round size disclosure partition is reported separately, because its disclosure rate differs from the population rate.

On a strict reading of the screen, the population underlying round size and primary dilution was fixed before any round size disclosure figure was computed, because the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. The round size disclosure partition puts 339 observations under full amount disclosed and reports 33.5% on a denominator of 1,013; initial tranche only is drawn from the same base so the two shares may be added. The methodology note adds that instruments bearing on round size disclosure came from 122 contributing firms for this edition.

9. Sensitivity to missing data

Read against the prior edition, two provisions in tension over round size disclosure are resolved by the coding rule rather than by judgement, and the disclosing subset is smaller than the population, and reporting against the population would overstate how often the term is absent. The share reported for not disclosed is 26.9%, from 273 observations in a denominator of 1,013, and range disclosed is measured on that denominator so neither absorbs the other's cases. It follows that observations sourced from a contemporaneous press report are admitted for round size disclosure but marked so in the source tier column.

As recorded in the decision log, an analyst recoding a round size disclosure observation must record the alternative, because the measurement window is fixed at the edition date, and observations are not backfilled once the edition has been published. Counting only disclosing observations, not disclosed reaches 26.9%, being 273 of 1,013; the figure for full amount disclosed shares that denominator and no observation is counted twice between them. Worth stating plainly: instruments bearing on round size disclosure came from 120 contributing firms for this edition.

In this volume's presentation, research design for round size disclosure begins from the population rather than the tabulation, because a term recorded as undisclosed is withheld from the denominator, the only treatment consistent with the disclosure rate printed beside it. The round size disclosure partition puts 339 observations under initial tranche only and reports 33.5% on a denominator of 1,013; not disclosed is drawn from the same base so the two shares may be added. The methodology note adds that within Series D and later the round size disclosure partition is reported separately, because its disclosure rate differs from the population rate.

At the level of the individual instrument, definitions governing round size disclosure are stated before any figure is reported, since the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. Applied to not disclosed, that gives 273 observations against a usable denominator of 1,013, or 26.9%; the comparison against initial tranche only rests on the same denominator, so the variants remain additive within the round size disclosure partition. Equally, the screen for this volume reads: financings with a disclosed aggregate commitment, measured over the window to 31 March 2026.

10. Comparison with the prior edition

For a reader auditing the screen, source tiering governs what may be asserted about round size disclosure, so the same company appearing in two financings contributes two observations only where both fall inside the measurement window. Reading the round size disclosure partition row by row, not disclosed carries 273 observations and 26.9%, measured against 1,013; the initial tranche only row is additive with it. The working papers add that within Series D and later the round size disclosure partition is reported separately, because its disclosure rate differs from the population rate.

Judged by the disclosure rate, quartiles rather than means are published for round size and primary dilution, since an instrument obtained after the edition closed is held for the next edition rather than folded into a published table. Counting only disclosing observations, full amount disclosed reaches 33.5%, being 339 of 1,013; the figure for not disclosed shares that denominator and no observation is counted twice between them. The composition tables show that observations sourced from a contemporaneous press report are admitted for round size disclosure but marked so in the source tier column.

As the screen was applied, outliers in the round size and primary dilution tables are retained and documented rather than trimmed, which means an observation excluded on review keeps its exclusion reason in the register, so the screen can be audited rather than trusted. Counting only disclosing observations, full amount disclosed reaches 33.5%, being 339 of 1,013; the figure for not disclosed shares that denominator and no observation is counted twice between them. The publisher notes that observations sourced from a executed instrument are admitted for round size disclosure but marked so in the source tier column.

In this volume's presentation, source tiering governs what may be asserted about round size disclosure, so the count admitted under the screen is stated in the register caption and is never adjusted afterwards to improve a result. 339 observations were coded initial tranche only, giving 33.5% against the 1,013 disclosing this field; full amount disclosed is reported beside it on the same base for comparability. The publisher notes that where supply-chain analytics observations are thin, the round size disclosure share is reported with its count rather than as a percentage alone.

Table 8.4 - round size and primary dilution cell counts by sector and stage, each cell carrying its own denominator

Sector within the round_size population	Series A	Series B	Series C	Series D and later	Growth	Row total
industrial robotics	27	36	13	7	27	110
warehouse automation	23	15	32	34	20	124
logistics software	22	22	8	33	33	118
supply-chain analytics	19	33	6	31	5	94
machine vision	30	12	8	14	17	81
autonomous systems	21	20	13	14	14	82
manufacturing software	15	5	7	32	7	66
fleet telematics	5	14	14	6	35	74
Column total	162	157	101	171	158	749

11. Limitations

Once the exclusions are applied, any engagement's own transaction is excluded from the round size and primary dilution comparison population, so the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. Reading the round size disclosure partition row by row, full amount disclosed carries 339 observations and 33.5%, measured against 1,013; the not disclosed row is additive with it. One consequence is that for the 2026 Q1 sub-period the round size disclosure count is published with its own denominator rather than folded into the annual figure.

As the screen was applied, because instruments disclose round size disclosure unevenly, the measurement window is fixed at the edition date, and observations are not backfilled once the edition has been published. full amount disclosed accounts for 339 of the 1,013 disclosing observations, 33.5% of them, and initial tranche only is tabulated on that identical base rather than on the wider population. As a practical matter, for the 2023 Q2 sub-period the round size disclosure count is published with its own denominator rather than folded into the annual figure.

As between the variants, denominators for round size disclosure rest on the disclosing subset alone, which means the screen is stated in full, so a reader who disagrees with it can identify which observations their own screen would drop. Applied to initial tranche only, that gives 339 observations against a usable denominator of 1,013, or 33.5%; the comparison against range disclosed rests on the same denominator, so the variants remain additive within the round size disclosure partition. A related point: within Series D and later the round size disclosure partition is reported separately, because its disclosure rate differs from the population rate.

Against the source hierarchy, coding practice for round size disclosure departs from loose market usage, in that a change since the prior edition is attributed to new observations, to a recode, or to a correction, and never left unexplained. Reading the round size disclosure partition row by row, initial tranche only carries 339 observations and 33.5%, measured against 1,013; the not disclosed row is additive with it. A qualification applies here: geographic coverage for round size disclosure is strongest in US Northeast and is reported as thin elsewhere.

12. Definitions

As the screen was applied, quartiles rather than means are published for round size and primary dilution, since a change since the prior edition is attributed to new observations, to a recode, or to a correction, and never left unexplained. initial tranche only accounts for 339 of the 1,013 disclosing observations, 33.5% of them, and range disclosed is tabulated on that identical base rather than on the wider population. A qualification applies here: the screen for this volume reads: financings with a disclosed aggregate commitment, measured over the window to 31 March 2026.

On the methodology, coding practice for round size disclosure departs from loose market usage, in that the disclosing subset is smaller than the population, and reporting against the population would overstate how often the term is absent. Reading the round size disclosure partition row by row, initial tranche only carries 339 observations and 33.5%, measured against 1,013; the initial tranche only row is additive with it. The methodology note adds that within Series D and later the round size disclosure partition is reported separately, because its disclosure rate differs from the population rate.

For a reader auditing the screen, coding practice for round size disclosure departs from loose market usage, in that the same company appearing in two financings contributes two observations only where both fall inside the measurement window. The round size disclosure partition puts 273 observations under not disclosed and reports 26.9% on a denominator of 1,013; range disclosed is drawn from the same base so the two shares may be added. Against that background, observations sourced from a executed instrument are admitted for round size disclosure but marked so in the source tier column.

By way of scope, segment cuts of round size disclosure describe the observed sample only, and the measurement window is fixed at the edition date, and observations are not backfilled once the edition has been published. The share reported for range disclosed is 6.1%, from 62 observations in a denominator of 1,013, and full amount disclosed is measured on that denominator so neither absorbs the other's cases. A qualification applies here: observations sourced from a executed instrument are admitted for round size disclosure but marked so in the source tier column.

For a reader auditing the screen, field-level disclosure rates for round size disclosure are published beside every share, so the count admitted under the screen is stated in the register caption and is never adjusted afterwards to improve a result. The round size disclosure partition puts 339 observations under full amount disclosed and reports 33.5% on a denominator of 1,013; range disclosed is drawn from the same base so the two shares may be added. A related point: observations sourced from a unverified secondary are admitted for round size disclosure but marked so in the source tier column.

Against the source hierarchy, this volume treats round size and primary dilution as its measured field, and the tier an observation came from constrains what this appendix will assert about it, and that constraint is printed rather than assumed. not disclosed accounts for 273 of the 1,013 disclosing observations, 26.9% of them, and full amount disclosed is tabulated on that identical base rather than on the wider population. Set against that, for the 2023 Q3 sub-period the round size disclosure count is published with its own denominator rather than folded into the annual figure.
