MARKET SURVEY STATISTICAL APPENDIX - RECORD 009

Helioscope Robotics, Inc. - diligence file reference MARKET_APPENDICES-009

1. Research question and scope

Kessler Ward Research publishes this volume on bridge and convertible instrument terms alongside the term survey covering financings from 1 July 2023 to 31 March 2026. It asks what caps, discounts and maturities appear on pre-round convertible paper, over 1,137 admitted observations of which 875 disclose convertible economics. Admission required that the financing be one of the convertible notes and safes obtained in the twelve months before a priced round.

At the level of the individual instrument, segment cuts of convertible economics describe the observed sample only, and the screen is stated in full, so a reader who disagrees with it can identify which observations their own screen would drop. Counting only disclosing observations, cap only reaches 4.7%, being 41 of 875; the figure for discount only shares that denominator and no observation is counted twice between them. The methodology note adds that geographic coverage for convertible economics is strongest in US South and is reported as thin elsewhere.

In this volume's presentation, source tiering governs what may be asserted about convertible economics, so no figure here rests on a single unverified secondary source without that being visible in the source tier column. Reading the convertible economics partition row by row, neither cap nor discount carries 324 observations and 37.0%, measured against 875; the neither cap nor discount row is additive with it. The reviewer also recorded that only where a filed instrument established it is the $8m to $20m revenue band applied to convertible economics.

By way of scope, source tiering governs what may be asserted about convertible economics, so the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. Reading the convertible economics partition row by row, cap and discount carries 117 observations and 13.4%, measured against 875; the cap only row is additive with it. In the same connection, within Series A the convertible economics partition is reported separately, because its disclosure rate differs from the population rate.

In this volume's presentation, an observation contributes to bridge and convertible instrument terms once only, and an instrument obtained after the edition closed is held for the next edition rather than folded into a published table. For cap and discount the register yields 117 observations, 13.4% of the 875 that disclose convertible economics, and the adjacent row for neither cap nor discount is computed identically. The publisher notes that only where a filed instrument established it is the $20m to $50m revenue band applied to convertible economics.

Register 9.1 - observations screened for the bridge and convertible instrument terms population (1,137 admitted)

1. Research question and scope - part 2 of 3

Set out next is the balance of the 1. Research question and scope, in the sequence in which the rows were originally compiled. Pagination alone determines where it falls.

Scope, cut-off and units for the 1. Research question and scope were fixed at its first part and are not repeated, being unaltered. The parts are to be read together.

Register 9.1 - observations screened for the bridge and convertible instrument terms population (1,137 admitted) (continued, part 2 of 3)

1. Research question and scope - part 3 of 3

The 1. Research question and scope begun above continues from this point, and its row references run consecutively across the parts rather than restarting. No row is omitted at the join.

The measurement basis recorded when the 1. Research question and scope opened is unchanged, so any figure here is comparable with any figure in the earlier parts. No row is omitted at the join.

Register 9.1 - observations screened for the bridge and convertible instrument terms population (1,137 admitted) (continued, part 3 of 3)

2. Population definition and screen

At the level of the individual instrument, composition of the bridge and convertible instrument terms sample changes between editions, and the disclosing subset is smaller than the population, and reporting against the population would overstate how often the term is absent. 41 observations were coded cap only, giving 4.7% against the 875 disclosing this field; cap and discount is reported beside it on the same base for comparability. For completeness, observations sourced from a counsel-confirmed summary are admitted for convertible economics but marked so in the source tier column.

Turning to the register, the population underlying bridge and convertible instrument terms was fixed before any convertible economics figure was computed, because an observation excluded on review keeps its exclusion reason in the register, so the screen can be audited rather than trusted. Counting only disclosing observations, cap only reaches 4.7%, being 41 of 875; the figure for cap and discount shares that denominator and no observation is counted twice between them. A qualification applies here: observations sourced from a contemporaneous press report are admitted for convertible economics but marked so in the source tier column.

Judged by the disclosure rate, outliers in the bridge and convertible instrument terms tables are retained and documented rather than trimmed, which means the tier an observation came from constrains what this appendix will assert about it, and that constraint is printed rather than assumed. cap only accounts for 41 of the 875 disclosing observations, 4.7% of them, and cap and discount is tabulated on that identical base rather than on the wider population. The working papers add that for the 2023 Q4 sub-period the convertible economics count is published with its own denominator rather than folded into the annual figure.

For the avoidance of doubt, the population underlying bridge and convertible instrument terms was fixed before any convertible economics figure was computed, because the tier an observation came from constrains what this appendix will assert about it, and that constraint is printed rather than assumed. The share reported for cap and discount is 13.4%, from 117 observations in a denominator of 875, and cap and discount is measured on that denominator so neither absorbs the other's cases. Against that background, where warehouse automation observations are thin, the convertible economics share is reported with its count rather than as a percentage alone.

3. Source hierarchy and admissibility

Before any tabulation, this volume treats bridge and convertible instrument terms as its measured field, and a change since the prior edition is attributed to new observations, to a recode, or to a correction, and never left unexplained. discount only accounts for 393 of the 875 disclosing observations, 44.9% of them, and discount only is tabulated on that

identical base rather than on the wider population. The publisher notes that observations sourced from a state or agency filing are admitted for convertible economics but marked so in the source tier column.

Against the source hierarchy, readers comparing this edition's convertible economics tables with the prior edition should note that an instrument obtained after the edition closed is held for the next edition rather than folded into a published table. Counting only disclosing observations, discount only reaches 44.9%, being 393 of 875; the figure for cap only shares that denominator and no observation is counted twice between them. It bears noting that geographic coverage for convertible economics is strongest in DACH and is reported as thin elsewhere.

Once the exclusions are applied, field-level disclosure rates for convertible economics are published beside every share, so the tier an observation came from constrains what this appendix will assert about it, and that constraint is printed rather than assumed. Counting only disclosing observations, neither cap nor discount reaches 37.0%, being 324 of 875; the figure for cap only shares that denominator and no observation is counted twice between them. The methodology note adds that observations sourced from a contemporaneous press report are admitted for convertible economics but marked so in the source tier column.

So far as disclosure permits, trend commentary on bridge and convertible instrument terms separates a movement in terms from a movement in the sample, and the tier an observation came from constrains what this appendix will assert about it, and that constraint is printed rather than assumed. 393 observations were coded discount only, giving 44.9% against the 875 disclosing this field; discount only is reported beside it on the same base for comparability. On the same evidence, for the 2024 Q1 sub-period the convertible economics count is published with its own denominator rather than folded into the annual figure.

4. Coding rules for ambiguous instruments

By way of scope, readers comparing this edition's convertible economics tables with the prior edition should note that the measurement window is fixed at the edition date, and observations are not backfilled once the edition has been published. The convertible economics partition puts 41 observations under cap only and reports 4.7% on a denominator of 875; cap and discount is drawn from the same base so the two shares may be added. The composition tables show that geographic coverage for convertible economics is strongest in UK and Ireland and is reported as thin elsewhere.

Against the source hierarchy, source tiering governs what may be asserted about convertible economics, so a change since the prior edition is attributed to new observations, to a recode, or to a correction, and never left unexplained. Counting only disclosing observations, neither cap nor discount reaches 37.0%, being 324 of 875; the figure for cap and discount shares that denominator and no observation is counted twice between them. A qualification applies here: observations sourced from a executed instrument are admitted for convertible economics but marked so in the source tier column.

By way of scope, sensitivity analysis reruns each convertible economics share under alternative treatments, and a term recorded as undisclosed is withheld from the denominator, the only treatment consistent with the disclosure rate printed beside it. The share reported for neither cap nor discount is 37.0%, from 324 observations in a denominator of 875, and discount only is measured on that denominator so neither absorbs the other's cases. One consequence is that geographic coverage for convertible economics is strongest in US South and is reported as thin elsewhere.

Where the sample is thin, quartiles rather than means are published for bridge and convertible instrument terms, since a change since the prior edition is attributed to new observations, to a recode, or to a correction, and never left unexplained. 117 observations were coded cap and discount, giving 13.4% against the 875 disclosing this field; cap only is reported beside it on the same base for comparability. It follows that instruments bearing on convertible economics came from 136 contributing firms for this edition.

Table 9.2 - convertible economics frequency on a usable denominator of 875

Convertible economics	Observations	Usable denominator	Share of usable	Prior edition share	Movement
cap only	41	875	4.7%	5.0%	-0.3 pp
discount only	393	875	44.9%	47.7%	-2.7 pp
cap and discount	117	875	13.4%	25.8%	-12.5 pp
neither cap nor discount	324	875	37.0%	21.5%	+15.5 pp

Convertible economics	Observations	Usable denominator	Share of usable	Prior edition share	Movement
not disclosed (excluded from denominator)	262	1,137	23.0%	-	-

5. Disclosure treatment and denominators

The screen for bridge and convertible instrument terms admits 1,137 observations, of which 262 say nothing about convertible economics, a disclosure rate of 77.0%. No table in this volume divides by 1,137. Doing so would credit the silent observations with an absence of convertible economics that no instrument supports.

Once the exclusions are applied, quartiles rather than means are published for bridge and convertible instrument terms, since the tier an observation came from constrains what this appendix will assert about it, and that constraint is printed rather than assumed. The share reported for cap and discount is 13.4%, from 117 observations in a denominator of 875, and neither cap nor discount is measured on that denominator so neither absorbs the other's cases. A related point: only where a filed instrument established it is the under $2m revenue band applied to convertible economics.

For a reader auditing the screen, denominators for convertible economics rest on the disclosing subset alone, which means a term recorded as undisclosed is withheld from the denominator, the only treatment consistent with the disclosure rate printed beside it. The convertible economics partition puts 393 observations under discount only and reports 44.9% on a denominator of 875; cap only is drawn from the same base so the two shares may be added. The publisher notes that for the 2023 Q2 sub-period the convertible economics count is published with its own denominator rather than folded into the annual figure.

For a reader auditing the screen, quartiles rather than means are published for bridge and convertible instrument terms, since the published share and the composition-adjusted share appear side by side, and where they diverge the attribution column says which. The share reported for neither cap nor discount is 37.0%, from 324 observations in a denominator of 875, and cap only is measured on that denominator so neither absorbs the other's cases. Set against that, for the 2024 Q4 sub-period the convertible economics count is published with its own denominator rather than folded into the annual figure.

In this volume's presentation, field-level disclosure rates for convertible economics are published beside every share, so the measurement window is fixed at the edition date, and observations are not backfilled once the edition has been published. Counting only disclosing observations, neither cap nor discount reaches 37.0%, being 324 of 875; the figure for cap and discount shares that denominator and no observation is counted twice between them. It follows that the screen for this volume reads: convertible notes and safes obtained in the twelve months before a priced round, measured over the window to 31 March 2026.

6. Reported distributions

As a matter of coding, research design for convertible economics begins from the population rather than the tabulation, because quartile spread carries information a mean conceals, particularly where a handful of financings sit far from the centre of the distribution. Counting only disclosing observations, cap only reaches 4.7%, being 41 of 875; the figure for cap only shares that denominator and no observation is counted twice between them. By the same token, the screen for this volume reads: convertible notes and safes obtained in the twelve months before a priced round, measured over the window to 31 March 2026.

Judged by the disclosure rate, composition of the bridge and convertible instrument terms sample changes between editions, and the tier an observation came from constrains what this appendix will assert about it, and that constraint is printed rather than assumed. Applied to cap only, that gives 41 observations against a usable denominator of 875, or 4.7%; the comparison against discount only rests on the same denominator, so the variants remain additive within the convertible economics partition. In the same connection, geographic coverage for convertible economics is strongest in Nordics and is reported as thin elsewhere.

Turning to the register, the population underlying bridge and convertible instrument terms was fixed before any convertible economics figure was computed, because the count admitted under the screen is stated in the register caption and is never adjusted afterwards to improve a result. For neither cap nor discount the register yields 324 observations,

37.0% of the 875 that disclose convertible economics, and the adjacent row for cap only is computed identically. In the same connection, where machine vision observations are thin, the convertible economics share is reported with its count rather than as a percentage alone.

Turning to the register, source tiering governs what may be asserted about convertible economics, so a change since the prior edition is attributed to new observations, to a recode, or to a correction, and never left unexplained. The share reported for cap and discount is 13.4%, from 117 observations in a denominator of 875, and discount only is measured on that denominator so neither absorbs the other's cases. The register records that observations sourced from a counsel-confirmed summary are admitted for convertible economics but marked so in the source tier column.

6. Reported distributions - part 2 of 3

Following on directly, these further rows of the 6. Reported distributions belong to the same schedule and share its numbering. The parts are to be read together.

The measurement basis recorded when the 6. Reported distributions opened is unchanged, so any figure here is comparable with any figure in the earlier parts. Nothing is restated from the earlier part.

Register 9.1 - observations screened for the bridge and convertible instrument terms population (1,137 admitted) (continued, part 2 of 3)

7. Segment cuts

Looking across the window, two provisions in tension over convertible economics are resolved by the coding rule rather than by judgement, and the count admitted under the screen is stated in the register caption and is never adjusted afterwards to improve a result. The convertible economics partition puts 324 observations under neither cap nor discount and reports 37.0% on a denominator of 875; cap only is drawn from the same base so the two shares may be added. The methodology note adds that only where a filed instrument established it is the $2m to $8m revenue band applied to convertible economics.

By way of scope, source tiering governs what may be asserted about convertible economics, so the tier an observation came from constrains what this appendix will assert about it, and that constraint is printed rather than assumed. Applied to cap only, that gives 41 observations against a usable denominator of 875, or 4.7%; the comparison against cap and discount rests on the same denominator, so the variants remain additive within the convertible economics partition. Equally, observations sourced from a unverified secondary are admitted for convertible economics but marked so in the source tier column.

So far as disclosure permits, contributing firms supply instruments bearing on convertible economics rather than summaries of them, and the measurement window is fixed at the edition date, and observations are not backfilled once the edition has been published. neither cap nor discount accounts for 324 of the 875 disclosing observations, 37.0% of them, and cap only is tabulated on that identical base rather than on the wider population. One consequence is that for the 2024 Q2 sub-period the convertible economics count is published with its own denominator rather than folded into the annual figure.

In the publisher's own terms, readers comparing this edition's convertible economics tables with the prior edition should note that a term recorded as undisclosed is withheld from the denominator, the only treatment consistent with the disclosure rate printed beside it. For cap only the register yields 41 observations, 4.7% of the 875 that disclose convertible economics, and the adjacent row for cap only is computed identically. Worth stating plainly: instruments bearing on convertible economics came from 120 contributing firms for this edition.

Table 9.6 - source tier composition of the bridge and convertible instrument terms population

Source tier for convertible economics	Observations	Share of population	Fields verifiable	Fields imputed	Treatment
executed instrument	114	10.0%	99	15	admitted for composition only
state or agency filing	366	32.2%	345	21	admitted for composition only
counsel-confirmed summary	122	10.7%	99	23	admitted without qualification
contemporaneous press report	228	20.1%	175	53	admitted without qualification
unverified secondary	307	27.0%	300	7	admitted without qualification

8. Trend analysis and composition change

For a reader auditing the screen, outliers in the bridge and convertible instrument terms tables are retained and documented rather than trimmed, which means an observation excluded on review keeps its exclusion reason in the register, so the screen can be audited rather than trusted. The share reported for cap only is 4.7%, from 41 observations in a denominator of 875, and cap only is measured on that denominator so neither absorbs the other's cases. Against that background, for the 2023 Q4 sub-period the convertible economics count is published with its own denominator rather than folded into the annual figure.

So far as disclosure permits, the population underlying bridge and convertible instrument terms was fixed before any convertible economics figure was computed, because an instrument obtained after the edition closed is held for the next edition rather than folded into a published table. cap and discount accounts for 117 of the 875 disclosing observations, 13.4% of them, and neither cap nor discount is tabulated on that identical base rather than on the wider population. For completeness, observations sourced from a contemporaneous press report are admitted for convertible economics but marked so in the source tier column.

At the level of the individual instrument, any engagement's own transaction is excluded from the bridge and convertible instrument terms comparison population, so the measurement window is fixed at the edition date, and observations are not backfilled once the edition has been published. cap and discount accounts for 117 of the 875 disclosing observations, 13.4% of them, and cap only is tabulated on that identical base rather than on the wider population. In the same connection, observations sourced from a contemporaneous press report are admitted for convertible economics but marked so in the source tier column.

In the publisher's own terms, two provisions in tension over convertible economics are resolved by the coding rule rather than by judgement, and the screen is stated in full, so a reader who disagrees with it can identify which observations their own screen would drop. The convertible economics partition puts 393 observations under discount only and reports 44.9% on a denominator of 875; cap and discount is drawn from the same base so the two shares may be added. Set against that, within Series A the convertible economics partition is reported separately, because its disclosure rate differs from the population rate.

9. Sensitivity to missing data

As recorded in the decision log, because instruments disclose convertible economics unevenly, a reader needing the underlying instrument can identify it from the register reference without asking the publisher for the file. The share reported for cap only is 4.7%, from 41 observations in a denominator of 875, and cap only is measured on that denominator so neither absorbs the other's cases. Against that background, only where a filed instrument established it is the $20m to $50m revenue band applied to convertible economics.

On a strict reading of the screen, where bridge and convertible instrument terms is concerned the screen admits an observation only when an observation excluded on review keeps its exclusion reason in the register, so the screen can be audited rather than trusted. Counting only disclosing observations, cap and discount reaches 13.4%, being 117 of 875; the figure for cap and discount shares that denominator and no observation is counted twice between them. By the same token, the screen for this volume reads: convertible notes and safes obtained in the twelve months before a priced round, measured over the window to 31 March 2026.

In the publisher's own terms, field-level disclosure rates for convertible economics are published beside every share, so a reader needing the underlying instrument can identify it from the register reference without asking the publisher for the file. The convertible economics partition puts 117 observations under cap and discount and reports 13.4% on a denominator of 875; discount only is drawn from the same base so the two shares may be added. As a practical matter, for the 2023 Q1 sub-period the convertible economics count is published with its own denominator rather than folded into the annual figure.

So far as disclosure permits, readers comparing this edition's convertible economics tables with the prior edition should note that an instrument obtained after the edition closed is held for the next edition rather than folded into a published table. Reading the convertible economics partition row by row, neither cap nor discount carries 324 observations and 37.0%, measured against 875; the cap and discount row is additive with it. Worth stating plainly: observations sourced from a executed instrument are admitted for convertible economics but marked so in the source tier column.

10. Comparison with the prior edition

Once the exclusions are applied, field-level disclosure rates for convertible economics are published beside every share, so the measurement window is fixed at the edition date, and observations are not backfilled once the edition has been published. Reading the convertible economics partition row by row, neither cap nor discount carries 324 observations and 37.0%, measured against 875; the cap and discount row is additive with it. A qualification applies here: instruments bearing on convertible economics came from 131 contributing firms for this edition.

In the publisher's own terms, sensitivity analysis reruns each convertible economics share under alternative treatments, and the published share and the composition-adjusted share appear side by side, and where they diverge the attribution column says which. 324 observations were coded neither cap nor discount, giving 37.0% against the 875 disclosing this field; neither cap nor discount is reported beside it on the same base for comparability. The publisher notes that the screen for this volume reads: convertible notes and safes obtained in the twelve months before a priced round, measured over the window to 31 March 2026.

Once the exclusions are applied, the population underlying bridge and convertible instrument terms was fixed before any convertible economics figure was computed, because no figure here rests on a single unverified secondary source without that being visible in the source tier column. Counting only disclosing observations, discount only reaches 44.9%, being 393 of 875; the figure for cap and discount shares that denominator and no observation is counted twice

between them. One consequence is that the screen for this volume reads: convertible notes and safes obtained in the twelve months before a priced round, measured over the window to 31 March 2026.

As the screen was applied, composition of the bridge and convertible instrument terms sample changes between editions, and the screen is stated in full, so a reader who disagrees with it can identify which observations their own screen would drop. Reading the convertible economics partition row by row, neither cap nor discount carries 324 observations and 37.0%, measured against 875; the neither cap nor discount row is additive with it. The composition tables show that within Series D and later the convertible economics partition is reported separately, because its disclosure rate differs from the population rate.

Table 9.7 - coding decisions on ambiguous instruments for convertible economics

10. Comparison with the prior edition - part 2 of 2

Because the 10. Comparison with the prior edition does not fit one page, its remainder is set out below under the same references.

Everything stated about how the 10. Comparison with the prior edition was assembled continues to hold, and the break carries no substantive meaning. Nothing is restated from the earlier part.

11. Limitations

At the level of the individual instrument, silence about convertible economics is not a negative observation here: the tier an observation came from constrains what this appendix will assert about it, and that constraint is printed rather than assumed. The share reported for cap and discount is 13.4%, from 117 observations in a denominator of 875, and

discount only is measured on that denominator so neither absorbs the other's cases. It follows that within Series B the convertible economics partition is reported separately, because its disclosure rate differs from the population rate.

Set beside the composition tables, quartiles rather than means are published for bridge and convertible instrument terms, since a term recorded as undisclosed is withheld from the denominator, the only treatment consistent with the disclosure rate printed beside it. cap only accounts for 41 of the 875 disclosing observations, 4.7% of them, and discount only is tabulated on that identical base rather than on the wider population. Against that background, only where a filed instrument established it is the under $2m revenue band applied to convertible economics.

For the avoidance of doubt, because instruments disclose convertible economics unevenly, the disclosing subset is smaller than the population, and reporting against the population would overstate how often the term is absent. The share reported for discount only is 44.9%, from 393 observations in a denominator of 875, and neither cap nor discount is measured on that denominator so neither absorbs the other's cases. In the same connection, only where a filed instrument established it is the under $2m revenue band applied to convertible economics.

For the avoidance of doubt, this volume treats bridge and convertible instrument terms as its measured field, and a term recorded as undisclosed is withheld from the denominator, the only treatment consistent with the disclosure rate printed beside it. cap only accounts for 41 of the 875 disclosing observations, 4.7% of them, and cap only is tabulated on that identical base rather than on the wider population. The working papers add that for the 2024 Q4 sub-period the convertible economics count is published with its own denominator rather than folded into the annual figure.

12. Definitions

Against the source hierarchy, field-level disclosure rates for convertible economics are published beside every share, so the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. Applied to cap and discount, that gives 117 observations against a usable denominator of 875, or 13.4%; the comparison against neither cap nor discount rests on the same denominator, so the variants remain additive within the convertible economics partition. The register records that the screen for this volume reads: convertible notes and safes obtained in the twelve months before a priced round, measured over the window to 31 March 2026.

Looking across the window, an observation contributes to bridge and convertible instrument terms once only, and a reader needing the underlying instrument can identify it from the register reference without asking the publisher for the file. 41 observations were coded cap only, giving 4.7% against the 875 disclosing this field; discount only is reported beside it on the same base for comparability. The composition tables show that within Growth the convertible economics partition is reported separately, because its disclosure rate differs from the population rate.

As the screen was applied, field-level disclosure rates for convertible economics are published beside every share, so the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. 324 observations were coded neither cap nor discount, giving 37.0% against the 875 disclosing this field; neither cap nor discount is reported beside it on the same base for comparability. Worth stating plainly: observations sourced from a counsel-confirmed summary are admitted for convertible economics but marked so in the source tier column.

By way of scope, any engagement's own transaction is excluded from the bridge and convertible instrument terms comparison population, so the disclosing subset is smaller than the population, and reporting against the population would overstate how often the term is absent. The share reported for discount only is 44.9%, from 393 observations in a denominator of 875, and cap only is measured on that denominator so neither absorbs the other's cases. In the same connection, instruments bearing on convertible economics came from 120 contributing firms for this edition.
