MARKET SURVEY STATISTICAL APPENDIX - RECORD 011

Helioscope Robotics, Inc. - diligence file reference MARKET_APPENDICES-011

1. Research question and scope

Kessler Ward Research publishes this volume on time between rounds and graduation alongside the term survey covering financings from 1 July 2023 to 31 March 2026. It asks how long companies take to reach the next priced round, and what share reach it at all, over 1,134 admitted observations of which 1,134 disclose cohort outcome. The screen admitting them reads: companies whose first priced financing falls in the cohort window.

Considered field by field, silence about cohort outcome is not a negative observation here: the tier an observation came from constrains what this appendix will assert about it, and that constraint is printed rather than assumed. 376 observations were coded next round in 18 to 30 months, giving 33.2% against the 1,134 disclosing this field; next round within 18 months is reported beside it on the same base for comparability. Against that background, observations sourced from a state or agency filing are admitted for cohort outcome but marked so in the source tier column.

Once the exclusions are applied, the population underlying time between rounds and graduation was fixed before any cohort outcome figure was computed, because a reader needing the underlying instrument can identify it from the register reference without asking the publisher for the file. Reading the cohort outcome partition row by row, next round within 18 months carries 376 observations and 33.2%, measured against 1,134; the next round within 18 months row is additive with it. The methodology note adds that instruments bearing on cohort outcome came from 122 contributing firms for this edition.

Put in terms of denominators, any engagement's own transaction is excluded from the time between rounds and graduation comparison population, so quartile spread carries information a mean conceals, particularly where a handful of financings sit far from the centre of the distribution. Applied to acquired or wound up, that gives 151 observations against a usable denominator of 1,134, or 13.3%; the comparison against next round after 30 months rests on the same denominator, so the variants remain additive within the cohort outcome partition. On the same evidence, where logistics software observations are thin, the cohort outcome share is reported with its count rather than as a percentage alone.

Turning to the register, quartiles rather than means are published for time between rounds and graduation, since the count admitted under the screen is stated in the register caption and is never adjusted afterwards to improve a result. The cohort outcome partition puts 376 observations under next round within 18 months and reports 33.2% on a denominator of 1,134; next round after 30 months is drawn from the same base so the two shares may be added. The methodology note adds that the screen for this volume reads: companies whose first priced financing falls in the cohort window, measured over the window to 31 March 2026.

Register 11.1 - observations screened for the time between rounds and graduation population (1,134 admitted)

1. Research question and scope - part 2 of 3

The 1. Research question and scope begun above continues from this point, and its row references run consecutively across the parts rather than restarting. Nothing is restated from the earlier part.

Scope, cut-off and units for the 1. Research question and scope were fixed at its first part and are not repeated, being unaltered.

Register 11.1 - observations screened for the time between rounds and graduation population (1,134 admitted) (continued, part 2 of 3)

1. Research question and scope - part 3 of 3

Continuing the 1. Research question and scope, the rows below follow directly on from part 3 minus one, with no gap in the reference sequence.

Treat the conventions declared for the 1. Research question and scope as governing here too; this part introduces none of its own. No row is omitted at the join.

Register 11.1 - observations screened for the time between rounds and graduation population (1,134 admitted) (continued, part 3 of 3)

2. Population definition and screen

Against the source hierarchy, denominators for cohort outcome rest on the disclosing subset alone, which means an instrument obtained after the edition closed is held for the next edition rather than folded into a published table. 376 observations were coded next round in 18 to 30 months, giving 33.2% against the 1,134 disclosing this field; next round within 18 months is reported beside it on the same base for comparability. A qualification applies here: observations sourced from a counsel-confirmed summary are admitted for cohort outcome but marked so in the source tier column.

On a strict reading of the screen, segment cuts of cohort outcome describe the observed sample only, and no figure here rests on a single unverified secondary source without that being visible in the source tier column. Applied to next round after 30 months, that gives 121 observations against a usable denominator of 1,134, or 10.7%; the comparison against next round in 18 to 30 months rests on the same denominator, so the variants remain additive within the cohort outcome partition. On the same evidence, observations sourced from a unverified secondary are admitted for cohort outcome but marked so in the source tier column.

As between the variants, an observation contributes to time between rounds and graduation once only, and the published share and the composition-adjusted share appear side by side, and where they diverge the attribution column says which. 151 observations were coded acquired or wound up, giving 13.3% against the 1,134 disclosing this field; next round within 18 months is reported beside it on the same base for comparability. For completeness, instruments bearing on cohort outcome came from 115 contributing firms for this edition.

As recorded in the decision log, quartiles rather than means are published for time between rounds and graduation, since quartile spread carries information a mean conceals, particularly where a handful of financings sit far from the centre of the distribution. Applied to no next round observed, that gives 110 observations against a usable denominator of 1,134, or 9.7%; the comparison against no next round observed rests on the same denominator, so the variants remain

additive within the cohort outcome partition. By the same token, instruments bearing on cohort outcome came from 120 contributing firms for this edition.

3. Source hierarchy and admissibility

In this volume's presentation, contributing firms supply instruments bearing on cohort outcome rather than summaries of them, and the same company appearing in two financings contributes two observations only where both fall inside the measurement window. Reading the cohort outcome partition row by row, acquired or wound up carries 151 observations and 13.3%, measured against 1,134; the acquired or wound up row is additive with it. As a practical matter, the screen for this volume reads: companies whose first priced financing falls in the cohort window, measured over the window to 31 March 2026.

Read against the prior edition, segment cuts of cohort outcome describe the observed sample only, and a reader needing the underlying instrument can identify it from the register reference without asking the publisher for the file. 151 observations were coded acquired or wound up, giving 13.3% against the 1,134 disclosing this field; no next round observed is reported beside it on the same base for comparability. It follows that geographic coverage for cohort outcome is strongest in UK and Ireland and is reported as thin elsewhere.

Against the source hierarchy, source tiering governs what may be asserted about cohort outcome, so a change since the prior edition is attributed to new observations, to a recode, or to a correction, and never left unexplained. Counting only disclosing observations, next round within 18 months reaches 33.2%, being 376 of 1,134; the figure for next round in 18 to 30 months shares that denominator and no observation is counted twice between them. A qualification applies here: instruments bearing on cohort outcome came from 137 contributing firms for this edition.

At the level of the individual instrument, any engagement's own transaction is excluded from the time between rounds and graduation comparison population, so a change since the prior edition is attributed to new observations, to a recode, or to a correction, and never left unexplained. Counting only disclosing observations, no next round observed reaches 9.7%, being 110 of 1,134; the figure for next round in 18 to 30 months shares that denominator and no observation is counted twice between them. A qualification applies here: instruments bearing on cohort outcome came from 124 contributing firms for this edition.

4. Coding rules for ambiguous instruments

Put in terms of denominators, because instruments disclose cohort outcome unevenly, the count admitted under the screen is stated in the register caption and is never adjusted afterwards to improve a result. The share reported for next round in 18 to 30 months is 33.2%, from 376 observations in a denominator of 1,134, and no next round observed is measured on that denominator so neither absorbs the other's cases. On the same evidence, the screen for this volume reads: companies whose first priced financing falls in the cohort window, measured over the window to 31 March 2026.

Once the exclusions are applied, field-level disclosure rates for cohort outcome are published beside every share, so the disclosing subset is smaller than the population, and reporting against the population would overstate how often the term is absent. The cohort outcome partition puts 151 observations under acquired or wound up and reports 13.3% on a denominator of 1,134; next round after 30 months is drawn from the same base so the two shares may be added. Worth stating plainly: the screen for this volume reads: companies whose first priced financing falls in the cohort window, measured over the window to 31 March 2026.

In this volume's presentation, limitations recorded for cohort outcome bear directly on how far its shares travel: the measurement window is fixed at the edition date, and observations are not backfilled once the edition has been published. 110 observations were coded no next round observed, giving 9.7% against the 1,134 disclosing this field; next round within 18 months is reported beside it on the same base for comparability. A qualification applies here: for the 2026 Q1 sub-period the cohort outcome count is published with its own denominator rather than folded into the annual figure.

In the analyst's working notes, definitions governing cohort outcome are stated before any figure is reported, since quartile spread carries information a mean conceals, particularly where a handful of financings sit far from the centre of the distribution. Reading the cohort outcome partition row by row, next round within 18 months carries 376 observations and 33.2%, measured against 1,134; the next round in 18 to 30 months row is additive with it. Set against that,

observations sourced from a counsel-confirmed summary are admitted for cohort outcome but marked so in the source tier column.

Table 11.2 - cohort outcome frequency on a usable denominator of 1,134

Cohort outcome	Observations	Usable denominator	Share of usable	Prior edition share	Movement
next round within 18 months	376	1,134	33.2%	35.2%	-2.0 pp
next round in 18 to 30 months	376	1,134	33.2%	24.4%	+8.7 pp
next round after 30 months	121	1,134	10.7%	9.8%	+0.9 pp
no next round observed	110	1,134	9.7%	9.4%	+0.3 pp
acquired or wound up	151	1,134	13.3%	21.2%	-7.8 pp
not disclosed (excluded from denominator)	0	1,134	0.0%	-	-

5. Disclosure treatment and denominators

There is no undisclosed subset in this volume. Time between rounds and graduation is classified from the screen itself, so the 1,134 admitted observations are also the 1,134 used in every share below. Volumes measuring a term recorded in an instrument report a smaller denominator, and say so in their own disclosure section.

Under the treatment adopted here, this volume treats time between rounds and graduation as its measured field, and the count admitted under the screen is stated in the register caption and is never adjusted afterwards to improve a result. For next round after 30 months the register yields 121 observations, 10.7% of the 1,134 that disclose cohort outcome, and the adjacent row for acquired or wound up is computed identically. The composition tables show that geographic coverage for cohort outcome is strongest in US Northeast and is reported as thin elsewhere.

Where the sample is thin, this volume treats time between rounds and graduation as its measured field, and the published share and the composition-adjusted share appear side by side, and where they diverge the attribution column says which. For next round in 18 to 30 months the register yields 376 observations, 33.2% of the 1,134 that disclose cohort outcome, and the adjacent row for next round in 18 to 30 months is computed identically. As a practical matter, geographic coverage for cohort outcome is strongest in Canada and is reported as thin elsewhere.

Against the source hierarchy, two provisions in tension over cohort outcome are resolved by the coding rule rather than by judgement, and the published share and the composition-adjusted share appear side by side, and where they diverge the attribution column says which. next round after 30 months accounts for 121 of the 1,134 disclosing observations, 10.7% of them, and next round in 18 to 30 months is tabulated on that identical base rather than on the wider population. It bears noting that instruments bearing on cohort outcome came from 115 contributing firms for this edition.

On the methodology, denominators for cohort outcome rest on the disclosing subset alone, which means a term recorded as undisclosed is withheld from the denominator, the only treatment consistent with the disclosure rate printed beside it. Reading the cohort outcome partition row by row, no next round observed carries 110 observations and 9.7%, measured against 1,134; the acquired or wound up row is additive with it. The publisher notes that instruments bearing on cohort outcome came from 109 contributing firms for this edition.

6. Reported distributions

Turning to the register, where time between rounds and graduation is concerned the screen admits an observation only when the published share and the composition-adjusted share appear side by side, and where they diverge the attribution column says which. The share reported for acquired or wound up is 13.3%, from 151 observations in a denominator of 1,134, and no next round observed is measured on that denominator so neither absorbs the other's cases. A qualification applies here: observations sourced from a contemporaneous press report are admitted for cohort outcome but marked so in the source tier column.

Before any tabulation, an analyst recoding a cohort outcome observation must record the alternative, because the tier an observation came from constrains what this appendix will assert about it, and that constraint is printed rather than

assumed. Reading the cohort outcome partition row by row, acquired or wound up carries 151 observations and 13.3%, measured against 1,134; the no next round observed row is additive with it. The publisher notes that within Series B the cohort outcome partition is reported separately, because its disclosure rate differs from the population rate.

Read against the prior edition, because instruments disclose cohort outcome unevenly, the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. For no next round observed the register yields 110 observations, 9.7% of the 1,134 that disclose cohort outcome, and the adjacent row for next round in 18 to 30 months is computed identically. By the same token, where machine vision observations are thin, the cohort outcome share is reported with its count rather than as a percentage alone.

Before any tabulation, readers comparing this edition's cohort outcome tables with the prior edition should note that the measurement window is fixed at the edition date, and observations are not backfilled once the edition has been published. The cohort outcome partition puts 121 observations under next round after 30 months and reports 10.7% on a denominator of 1,134; next round in 18 to 30 months is drawn from the same base so the two shares may be added. The working papers add that where fleet telematics observations are thin, the cohort outcome share is reported with its count rather than as a percentage alone.

6. Reported distributions - part 2 of 3

Continuing the 6. Reported distributions, the rows below follow directly on from part 2 minus one, with no gap in the reference sequence.

Because the basis of the 6. Reported distributions is unchanged, figures in this part may be compared directly with those already given. No row is omitted at the join.

Register 11.1 - observations screened for the time between rounds and graduation population (1,134 admitted) (continued, part 2 of 3)

6. Reported distributions - part 3 of 3

For length, the 6. Reported distributions is presented in 3 parts; this is the next of them, and the rows continue the same sequence.

Nothing in this part varies how the 6. Reported distributions was compiled, and the headings given at the start remain the operative ones. The sequence is unbroken either side of it.

Register 11.1 - observations screened for the time between rounds and graduation population (1,134 admitted) (continued, part 3 of 3)

7. Segment cuts

Before any tabulation, quartiles rather than means are published for time between rounds and graduation, since the disclosing subset is smaller than the population, and reporting against the population would overstate how often the term is absent. Applied to next round in 18 to 30 months, that gives 376 observations against a usable denominator of 1,134, or 33.2%; the comparison against no next round observed rests on the same denominator, so the variants remain additive within the cohort outcome partition. It bears noting that where supply-chain analytics observations are thin, the cohort outcome share is reported with its count rather than as a percentage alone.

As the screen was applied, outliers in the time between rounds and graduation tables are retained and documented rather than trimmed, which means the same company appearing in two financings contributes two observations only where both fall inside the measurement window. The share reported for acquired or wound up is 13.3%, from 151 observations in a denominator of 1,134, and next round after 30 months is measured on that denominator so neither absorbs the other's cases. The methodology note adds that within Series C the cohort outcome partition is reported separately, because its disclosure rate differs from the population rate.

As between the variants, definitions governing cohort outcome are stated before any figure is reported, since the published share and the composition-adjusted share appear side by side, and where they diverge the attribution column says which. no next round observed accounts for 110 of the 1,134 disclosing observations, 9.7% of them, and acquired or wound up is tabulated on that identical base rather than on the wider population. A qualification applies here: where fleet telematics observations are thin, the cohort outcome share is reported with its count rather than as a percentage alone.

Measured over the whole window, an observation contributes to time between rounds and graduation once only, and the screen is stated in full, so a reader who disagrees with it can identify which observations their own screen would drop. acquired or wound up accounts for 151 of the 1,134 disclosing observations, 13.3% of them, and next round within 18 months is tabulated on that identical base rather than on the wider population. A related point: geographic coverage for cohort outcome is strongest in DACH and is reported as thin elsewhere.

Table 11.6 - source tier composition of the time between rounds and graduation population

Source tier for cohort outcome	Observations	Share of population	Fields verifiable	Fields imputed	Treatment
executed instrument	251	22.1%	203	48	admitted for composition only
state or agency filing	177	15.6%	155	22	admitted for composition only
counsel-confirmed summary	248	21.9%	197	51	admitted, field-level caveat
contemporaneous press report	230	20.3%	202	28	admitted for composition only
unverified secondary	228	20.1%	190	38	admitted without qualification

8. Trend analysis and composition change

Set beside the composition tables, quartiles rather than means are published for time between rounds and graduation, since the tier an observation came from constrains what this appendix will assert about it, and that constraint is printed rather than assumed. Counting only disclosing observations, next round within 18 months reaches 33.2%, being 376 of 1,134; the figure for no next round observed shares that denominator and no observation is counted twice between

them. The publisher notes that observations sourced from a executed instrument are admitted for cohort outcome but marked so in the source tier column.

Set beside the composition tables, coding practice for cohort outcome departs from loose market usage, in that a reader needing the underlying instrument can identify it from the register reference without asking the publisher for the file. For next round within 18 months the register yields 376 observations, 33.2% of the 1,134 that disclose cohort outcome, and the adjacent row for next round after 30 months is computed identically. Equally, for the 2023 Q2 sub-period the cohort outcome count is published with its own denominator rather than folded into the annual figure.

At the level of the individual instrument, limitations recorded for cohort outcome bear directly on how far its shares travel: the tier an observation came from constrains what this appendix will assert about it, and that constraint is printed rather than assumed. Counting only disclosing observations, next round within 18 months reaches 33.2%, being 376 of 1,134; the figure for next round after 30 months shares that denominator and no observation is counted twice between them. Set against that, the screen for this volume reads: companies whose first priced financing falls in the cohort window, measured over the window to 31 March 2026.

Considered field by field, denominators for cohort outcome rest on the disclosing subset alone, which means the tier an observation came from constrains what this appendix will assert about it, and that constraint is printed rather than assumed. Applied to acquired or wound up, that gives 151 observations against a usable denominator of 1,134, or 13.3%; the comparison against next round after 30 months rests on the same denominator, so the variants remain additive within the cohort outcome partition. The working papers add that within Series C the cohort outcome partition is reported separately, because its disclosure rate differs from the population rate.

9. Sensitivity to missing data

Once the exclusions are applied, coding practice for cohort outcome departs from loose market usage, in that the disclosing subset is smaller than the population, and reporting against the population would overstate how often the term is absent. Applied to no next round observed, that gives 110 observations against a usable denominator of 1,134, or 9.7%; the comparison against acquired or wound up rests on the same denominator, so the variants remain additive within the cohort outcome partition. Against that background, within Series C the cohort outcome partition is reported separately, because its disclosure rate differs from the population rate.

As recorded in the decision log, two provisions in tension over cohort outcome are resolved by the coding rule rather than by judgement, and a change since the prior edition is attributed to new observations, to a recode, or to a correction, and never left unexplained. Reading the cohort outcome partition row by row, next round within 18 months carries 376 observations and 33.2%, measured against 1,134; the acquired or wound up row is additive with it. A related point: instruments bearing on cohort outcome came from 121 contributing firms for this edition.

As a matter of coding, this volume treats time between rounds and graduation as its measured field, and a reader needing the underlying instrument can identify it from the register reference without asking the publisher for the file. For next round in 18 to 30 months the register yields 376 observations, 33.2% of the 1,134 that disclose cohort outcome, and the adjacent row for next round within 18 months is computed identically. The working papers add that the screen for this volume reads: companies whose first priced financing falls in the cohort window, measured over the window to 31 March 2026.

For a reader auditing the screen, because instruments disclose cohort outcome unevenly, a term recorded as undisclosed is withheld from the denominator, the only treatment consistent with the disclosure rate printed beside it. Reading the cohort outcome partition row by row, next round in 18 to 30 months carries 376 observations and 33.2%, measured against 1,134; the next round within 18 months row is additive with it. A related point: where supply-chain analytics observations are thin, the cohort outcome share is reported with its count rather than as a percentage alone.

10. Comparison with the prior edition

As between the variants, where time between rounds and graduation is concerned the screen admits an observation only when the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. For no next round observed the register yields 110 observations, 9.7% of the 1,134 that disclose cohort outcome, and the adjacent row for no next round observed is computed identically. One consequence is

that within Series D and later the cohort outcome partition is reported separately, because its disclosure rate differs from the population rate.

Looking across the window, because instruments disclose cohort outcome unevenly, the tier an observation came from constrains what this appendix will assert about it, and that constraint is printed rather than assumed. The cohort outcome partition puts 376 observations under next round within 18 months and reports 33.2% on a denominator of 1,134; next round within 18 months is drawn from the same base so the two shares may be added. One consequence is that only where a filed instrument established it is the $2m to $8m revenue band applied to cohort outcome.

Turning to the register, an observation contributes to time between rounds and graduation once only, and the count admitted under the screen is stated in the register caption and is never adjusted afterwards to improve a result. Reading the cohort outcome partition row by row, next round within 18 months carries 376 observations and 33.2%, measured against 1,134; the next round in 18 to 30 months row is additive with it. Equally, within Series C the cohort outcome partition is reported separately, because its disclosure rate differs from the population rate.

Measured over the whole window, quartiles rather than means are published for time between rounds and graduation, since a change since the prior edition is attributed to new observations, to a recode, or to a correction, and never left unexplained. For next round in 18 to 30 months the register yields 376 observations, 33.2% of the 1,134 that disclose cohort outcome, and the adjacent row for next round in 18 to 30 months is computed identically. The reviewer also recorded that geographic coverage for cohort outcome is strongest in DACH and is reported as thin elsewhere.

Table 11.7 - coding decisions on ambiguous instruments for cohort outcome

Cohort outcome coding decision	Coding applied	Ambiguity	Alternative coding	Effect on result
CD-11-001	next round after 30 months	amendment post-dates the round	next round within 18 months	shifts share by under half a point
CD-11-002	next round within 18 months	defined term differs from market usage	next round within 18 months	no effect on published share
CD-11-003	acquired or wound up	two provisions in tension	acquired or wound up	no effect on published share
CD-11-004	next round in 18 to 30 months	defined term differs from market usage	next round after 30 months	no effect on published share
CD-11-005	no next round observed	defined term differs from market usage	next round within 18 months	shifts share by under half a point
CD-11-006	next round within 18 months	two provisions in tension	next round within 18 months	observation dropped instead

10. Comparison with the prior edition - part 2 of 2

Below, the 10. Comparison with the prior edition continues; nothing separates this part from the last except the page on which it happens to fall. Nothing is restated from the earlier part.

Readers should carry the 10. Comparison with the prior edition's stated conventions across the break, since this part adds no definition of its own. The parts are to be read together.

Table 11.7 - coding decisions on ambiguous instruments for cohort outcome (continued, part 2 of 2)

Cohort outcome coding decision	Coding applied	Ambiguity	Alternative coding	Effect on result
CD-11-061	next round after 30 months	side letter varies the charter	acquired or wound up	no effect on published share

11. Limitations

Once the exclusions are applied, an analyst recoding a cohort outcome observation must record the alternative, because an observation excluded on review keeps its exclusion reason in the register, so the screen can be audited rather than trusted. Counting only disclosing observations, acquired or wound up reaches 13.3%, being 151 of 1,134; the figure for acquired or wound up shares that denominator and no observation is counted twice between them. A qualification applies here: only where a filed instrument established it is the under $2m revenue band applied to cohort outcome.

At the level of the individual instrument, an analyst recoding a cohort outcome observation must record the alternative, because an instrument obtained after the edition closed is held for the next edition rather than folded into a published table. Counting only disclosing observations, next round within 18 months reaches 33.2%, being 376 of 1,134; the figure for next round within 18 months shares that denominator and no observation is counted twice between them. In the same connection, only where a filed instrument established it is the $20m to $50m revenue band applied to cohort outcome.

Framed as a research question, outliers in the time between rounds and graduation tables are retained and documented rather than trimmed, which means the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. The cohort outcome partition puts 110 observations under no next round observed and reports 9.7% on a denominator of 1,134; next round after 30 months is drawn from the same base so the two shares may be added. In the same connection, only where a filed instrument established it is the $8m to $20m revenue band applied to cohort outcome.

On the methodology, research design for cohort outcome begins from the population rather than the tabulation, because a term recorded as undisclosed is withheld from the denominator, the only treatment consistent with the disclosure rate printed beside it. no next round observed accounts for 110 of the 1,134 disclosing observations, 9.7% of them, and no next round observed is tabulated on that identical base rather than on the wider population. Set against that, observations sourced from a unverified secondary are admitted for cohort outcome but marked so in the source tier column.

12. Definitions

For the avoidance of doubt, this volume treats time between rounds and graduation as its measured field, and the published share and the composition-adjusted share appear side by side, and where they diverge the attribution column says which. next round after 30 months accounts for 121 of the 1,134 disclosing observations, 10.7% of them, and next round within 18 months is tabulated on that identical base rather than on the wider population. On the same evidence, the screen for this volume reads: companies whose first priced financing falls in the cohort window, measured over the window to 31 March 2026.

For the avoidance of doubt, segment cuts of cohort outcome describe the observed sample only, and quartile spread carries information a mean conceals, particularly where a handful of financings sit far from the centre of the distribution. Applied to next round after 30 months, that gives 121 observations against a usable denominator of 1,134, or 10.7%; the comparison against next round in 18 to 30 months rests on the same denominator, so the variants remain additive within the cohort outcome partition. The composition tables show that only where a filed instrument established it is the $8m to $20m revenue band applied to cohort outcome.

Put in terms of denominators, readers comparing this edition's cohort outcome tables with the prior edition should note that the tier an observation came from constrains what this appendix will assert about it, and that constraint is printed rather than assumed. The share reported for next round within 18 months is 33.2%, from 376 observations in a denominator of 1,134, and next round after 30 months is measured on that denominator so neither absorbs the other's cases. In the same connection, the screen for this volume reads: companies whose first priced financing falls in the cohort window, measured over the window to 31 March 2026.

Looking across the window, definitions governing cohort outcome are stated before any figure is reported, since the disclosing subset is smaller than the population, and reporting against the population would overstate how often the term is absent. The share reported for next round within 18 months is 33.2%, from 376 observations in a denominator of 1,134, and next round after 30 months is measured on that denominator so neither absorbs the other's cases. The working papers add that within Series A the cohort outcome partition is reported separately, because its disclosure rate differs from the population rate.

On a strict reading of the screen, limitations recorded for cohort outcome bear directly on how far its shares travel: an instrument obtained after the edition closed is held for the next edition rather than folded into a published table. Counting only disclosing observations, next round in 18 to 30 months reaches 33.2%, being 376 of 1,134; the figure for next round after 30 months shares that denominator and no observation is counted twice between them. The working papers add that geographic coverage for cohort outcome is strongest in DACH and is reported as thin elsewhere.

As between the variants, definitions governing cohort outcome are stated before any figure is reported, since a change since the prior edition is attributed to new observations, to a recode, or to a correction, and never left unexplained. 121 observations were coded next round after 30 months, giving 10.7% against the 1,134 disclosing this field; no next round observed is reported beside it on the same base for comparability. As a practical matter, only where a filed instrument established it is the $20m to $50m revenue band applied to cohort outcome.
