MARKET SURVEY STATISTICAL APPENDIX - RECORD 012

Helioscope Robotics, Inc. - diligence file reference MARKET_APPENDICES-012

1. Research question and scope

Kessler Ward Research publishes this volume on secondary transactions and tenders alongside the term survey covering financings from 1 July 2023 to 31 March 2026. It asks how often secondary liquidity occurs alongside a primary round, and at what relative price, over 1,211 admitted observations of which 823 disclose secondary structure. Admission required that the financing be one of the financings whose transfer consents or tender documents were obtained.

For the avoidance of doubt, denominators for secondary structure rest on the disclosing subset alone, which means the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. The secondary structure partition puts 179 observations under fund-to-fund purchase and reports 21.7% on a denominator of 823; fund-to-fund purchase is drawn from the same base so the two shares may be added. Equally, only where a filed instrument established it is the $8m to $20m revenue band applied to secondary structure.

Set beside the composition tables, source tiering governs what may be asserted about secondary structure, so the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. The secondary structure partition puts 179 observations under fund-to-fund purchase and reports 21.7% on a denominator of 823; no secondary observed is drawn from the same base so the two shares may be added. It follows that the screen for this volume reads: financings whose transfer consents or tender documents were obtained, measured over the window to 31 March 2026.

Under the treatment adopted here, silence about secondary structure is not a negative observation here: the same company appearing in two financings contributes two observations only where both fall inside the measurement window. For direct transfer with consent the register yields 162 observations, 19.7% of the 823 that disclose secondary structure, and the adjacent row for direct transfer with consent is computed identically. By the same token, geographic coverage for secondary structure is strongest in Nordics and is reported as thin elsewhere.

Measured over the whole window, an observation contributes to secondary transactions and tenders once only, and an observation excluded on review keeps its exclusion reason in the register, so the screen can be audited rather than trusted. The share reported for direct transfer with consent is 19.7%, from 162 observations in a denominator of 823, and company-run tender is measured on that denominator so neither absorbs the other's cases. It follows that for the 2025 Q4 sub-period the secondary structure count is published with its own denominator rather than folded into the annual figure.

Register 12.1 - observations screened for the secondary transactions and tenders population (1,211 admitted)

1. Research question and scope - part 2 of 3

Continuing the 1. Research question and scope, the rows below follow directly on from part 2 minus one, with no gap in the reference sequence. The sequence is unbroken either side of it.

Whatever caveat the 1. Research question and scope carried at its head travels with these rows, and no additional caveat attaches to this part. The parts are to be read together.

Register 12.1 - observations screened for the secondary transactions and tenders population (1,211 admitted) (continued, part 2 of 3)

2. Population definition and screen

So far as disclosure permits, definitions governing secondary structure are stated before any figure is reported, since a reader needing the underlying instrument can identify it from the register reference without asking the publisher for the file. Applied to company-run tender, that gives 16 observations against a usable denominator of 823, or 1.9%; the comparison against company-run tender rests on the same denominator, so the variants remain additive within the secondary structure partition. Worth stating plainly: for the 2026 Q1 sub-period the secondary structure count is published with its own denominator rather than folded into the annual figure.

As recorded in the decision log, outliers in the secondary transactions and tenders tables are retained and documented rather than trimmed, which means an observation excluded on review keeps its exclusion reason in the register, so the screen can be audited rather than trusted. Applied to no secondary observed, that gives 466 observations against a usable denominator of 823, or 56.6%; the comparison against direct transfer with consent rests on the same denominator, so the variants remain additive within the secondary structure partition. The methodology note adds that the screen for this volume reads: financings whose transfer consents or tender documents were obtained, measured over the window to 31 March 2026.

Under the treatment adopted here, research design for secondary structure begins from the population rather than the tabulation, because a reader needing the underlying instrument can identify it from the register reference without asking the publisher for the file. The share reported for no secondary observed is 56.6%, from 466 observations in a denominator of 823, and company-run tender is measured on that denominator so neither absorbs the other's cases. The methodology note adds that instruments bearing on secondary structure came from 131 contributing firms for this edition.

On a strict reading of the screen, segment cuts of secondary structure describe the observed sample only, and a change since the prior edition is attributed to new observations, to a recode, or to a correction, and never left unexplained. For no secondary observed the register yields 466 observations, 56.6% of the 823 that disclose secondary structure, and the adjacent row for company-run tender is computed identically. One consequence is that instruments bearing on secondary structure came from 123 contributing firms for this edition.

3. Source hierarchy and admissibility

By way of scope, research design for secondary structure begins from the population rather than the tabulation, because the screen is stated in full, so a reader who disagrees with it can identify which observations their own screen would drop. Applied to fund-to-fund purchase, that gives 179 observations against a usable denominator of 823, or 21.7%; the comparison against no secondary observed rests on the same denominator, so the variants remain additive within the secondary structure partition. For completeness, geographic coverage for secondary structure is strongest in US West and is reported as thin elsewhere.

Before any tabulation, trend commentary on secondary transactions and tenders separates a movement in terms from a movement in the sample, and a reader needing the underlying instrument can identify it from the register reference without asking the publisher for the file. Applied to fund-to-fund purchase, that gives 179 observations against a usable denominator of 823, or 21.7%; the comparison against company-run tender rests on the same denominator, so the variants remain additive within the secondary structure partition. By the same token, the screen for this volume reads: financings whose transfer consents or tender documents were obtained, measured over the window to 31 March 2026.

Measured over the whole window, outliers in the secondary transactions and tenders tables are retained and documented rather than trimmed, which means the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. 16 observations were coded company-run tender, giving 1.9% against the 823 disclosing this field; no secondary observed is reported beside it on the same base for comparability. On the same evidence, where logistics software observations are thin, the secondary structure share is reported with its count rather than as a percentage alone.

Turning to the register, denominators for secondary structure rest on the disclosing subset alone, which means the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. The share reported for no secondary observed is 56.6%, from 466 observations in a denominator of 823, and direct transfer with consent is measured on that denominator so neither absorbs the other's cases. Against that background, only where a filed instrument established it is the $20m to $50m revenue band applied to secondary structure.

4. Coding rules for ambiguous instruments

In the analyst's working notes, sensitivity analysis reruns each secondary structure share under alternative treatments, and no figure here rests on a single unverified secondary source without that being visible in the source tier column. Counting only disclosing observations, company-run tender reaches 1.9%, being 16 of 823; the figure for company-run tender shares that denominator and no observation is counted twice between them. Set against that, observations sourced from a counsel-confirmed summary are admitted for secondary structure but marked so in the source tier column.

So far as disclosure permits, composition of the secondary transactions and tenders sample changes between editions, and an observation excluded on review keeps its exclusion reason in the register, so the screen can be audited rather than trusted. 16 observations were coded company-run tender, giving 1.9% against the 823 disclosing this field; company-run tender is reported beside it on the same base for comparability. It bears noting that within Series D and later the secondary structure partition is reported separately, because its disclosure rate differs from the population rate.

With the register open alongside, field-level disclosure rates for secondary structure are published beside every share, so the tier an observation came from constrains what this appendix will assert about it, and that constraint is printed rather than assumed. The share reported for no secondary observed is 56.6%, from 466 observations in a denominator of 823, and no secondary observed is measured on that denominator so neither absorbs the other's cases. The register records that for the 2024 Q4 sub-period the secondary structure count is published with its own denominator rather than folded into the annual figure.

In the publisher's own terms, research design for secondary structure begins from the population rather than the tabulation, because a reader needing the underlying instrument can identify it from the register reference without asking the publisher for the file. Applied to company-run tender, that gives 16 observations against a usable denominator of 823, or 1.9%; the comparison against fund-to-fund purchase rests on the same denominator, so the variants remain additive within the secondary structure partition. Against that background, geographic coverage for secondary structure is strongest in DACH and is reported as thin elsewhere.

Table 12.2 - secondary structure frequency on a usable denominator of 823

Secondary structure	Observations	Usable denominator	Share of usable	Prior edition share	Movement
company-run tender	16	823	1.9%	4.1%	-2.2 pp
direct transfer with consent	162	823	19.7%	52.0%	-32.3 pp
fund-to-fund purchase	179	823	21.7%	31.5%	-9.7 pp

Secondary structure	Observations	Usable denominator	Share of usable	Prior edition share	Movement
no secondary observed	466	823	56.6%	12.4%	+44.2 pp
not disclosed (excluded from denominator)	388	1,211	32.0%	-	-

5. Disclosure treatment and denominators

Secondary structure is disclosed by 823 of the 1,211 observations this volume admits, leaving 388 silent, a disclosure rate of 68.0%. No table in this volume divides by 1,211. Doing so would credit the silent observations with an absence of secondary structure that no instrument supports.

Framed as a research question, source tiering governs what may be asserted about secondary structure, so no figure here rests on a single unverified secondary source without that being visible in the source tier column. Reading the secondary structure partition row by row, fund-to-fund purchase carries 179 observations and 21.7%, measured against 823; the fund-to-fund purchase row is additive with it. The methodology note adds that only where a filed instrument established it is the $2m to $8m revenue band applied to secondary structure.

In the analyst's working notes, an analyst recoding a secondary structure observation must record the alternative, because an instrument obtained after the edition closed is held for the next edition rather than folded into a published table. The share reported for company-run tender is 1.9%, from 16 observations in a denominator of 823, and direct transfer with consent is measured on that denominator so neither absorbs the other's cases. The methodology note adds that for the 2024 Q4 sub-period the secondary structure count is published with its own denominator rather than folded into the annual figure.

In the analyst's working notes, composition of the secondary transactions and tenders sample changes between editions, and the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. Applied to fund-to-fund purchase, that gives 179 observations against a usable denominator of 823, or 21.7%; the comparison against fund-to-fund purchase rests on the same denominator, so the variants remain additive within the secondary structure partition. Equally, for the 2023 Q3 sub-period the secondary structure count is published with its own denominator rather than folded into the annual figure.

Looking across the window, limitations recorded for secondary structure bear directly on how far its shares travel: no figure here rests on a single unverified secondary source without that being visible in the source tier column. Reading the secondary structure partition row by row, direct transfer with consent carries 162 observations and 19.7%, measured against 823; the no secondary observed row is additive with it. The working papers add that the screen for this volume reads: financings whose transfer consents or tender documents were obtained, measured over the window to 31 March 2026.

6. Reported distributions

Measured over the whole window, an observation contributes to secondary transactions and tenders once only, and the screen is stated in full, so a reader who disagrees with it can identify which observations their own screen would drop. The secondary structure partition puts 466 observations under no secondary observed and reports 56.6% on a denominator of 823; no secondary observed is drawn from the same base so the two shares may be added. Set against that, within Series B the secondary structure partition is reported separately, because its disclosure rate differs from the population rate.

Against the source hierarchy, readers comparing this edition's secondary structure tables with the prior edition should note that the disclosing subset is smaller than the population, and reporting against the population would overstate how often the term is absent. For no secondary observed the register yields 466 observations, 56.6% of the 823 that disclose secondary structure, and the adjacent row for direct transfer with consent is computed identically. Set against that, only where a filed instrument established it is the $20m to $50m revenue band applied to secondary structure.

Taken at the population level, outliers in the secondary transactions and tenders tables are retained and documented rather than trimmed, which means quartile spread carries information a mean conceals, particularly where a handful of financings sit far from the centre of the distribution. Reading the secondary structure partition row by row, fund-to-fund

purchase carries 179 observations and 21.7%, measured against 823; the company-run tender row is additive with it. For completeness, only where a filed instrument established it is the over $50m revenue band applied to secondary structure.

For a reader auditing the screen, outliers in the secondary transactions and tenders tables are retained and documented rather than trimmed, which means the disclosing subset is smaller than the population, and reporting against the population would overstate how often the term is absent. The share reported for direct transfer with consent is 19.7%, from 162 observations in a denominator of 823, and no secondary observed is measured on that denominator so neither absorbs the other's cases. On the same evidence, geographic coverage for secondary structure is strongest in DACH and is reported as thin elsewhere.

6. Reported distributions - part 2 of 3

A further extract of the 6. Reported distributions appears here, taken in order from the point at which the previous part ended. Pagination alone determines where it falls.

Scope, cut-off and units for the 6. Reported distributions were fixed at its first part and are not repeated, being unaltered. The break is editorial.

Register 12.1 - observations screened for the secondary transactions and tenders population (1,211 admitted) (continued, part 2 of 3)

6. Reported distributions - part 3 of 3

For length, the 6. Reported distributions is presented in 3 parts; this is the next of them, and the rows continue the same sequence. Pagination alone determines where it falls.

Everything stated about how the 6. Reported distributions was assembled continues to hold, and the break carries no substantive meaning. No row is omitted at the join.

Register 12.1 - observations screened for the secondary transactions and tenders population (1,211 admitted) (continued, part 3 of 3)

7. Segment cuts

As recorded in the decision log, contributing firms supply instruments bearing on secondary structure rather than summaries of them, and the disclosing subset is smaller than the population, and reporting against the population would overstate how often the term is absent. company-run tender accounts for 16 of the 823 disclosing observations, 1.9% of them, and company-run tender is tabulated on that identical base rather than on the wider population. In the same connection, for the 2024 Q1 sub-period the secondary structure count is published with its own denominator rather than folded into the annual figure.

As between the variants, research design for secondary structure begins from the population rather than the tabulation, because a change since the prior edition is attributed to new observations, to a recode, or to a correction, and never left unexplained. Counting only disclosing observations, fund-to-fund purchase reaches 21.7%, being 179 of 823;

the figure for company-run tender shares that denominator and no observation is counted twice between them. Against that background, where manufacturing software observations are thin, the secondary structure share is reported with its count rather than as a percentage alone.

With the register open alongside, quartiles rather than means are published for secondary transactions and tenders, since the measurement window is fixed at the edition date, and observations are not backfilled once the edition has been published. Applied to direct transfer with consent, that gives 162 observations against a usable denominator of 823, or 19.7%; the comparison against direct transfer with consent rests on the same denominator, so the variants remain additive within the secondary structure partition. For completeness, observations sourced from a counsel-confirmed summary are admitted for secondary structure but marked so in the source tier column.

On a strict reading of the screen, the population underlying secondary transactions and tenders was fixed before any secondary structure figure was computed, because an observation excluded on review keeps its exclusion reason in the register, so the screen can be audited rather than trusted. The share reported for company-run tender is 1.9%, from 16 observations in a denominator of 823, and fund-to-fund purchase is measured on that denominator so neither absorbs the other's cases. A related point: within Series A the secondary structure partition is reported separately, because its disclosure rate differs from the population rate.

Table 12.9 - movement in secondary structure against the prior edition, by cause

Secondary structure movement	Prior edition	This edition	Underlying change	Attributed cause
company-run tender	29.7%	26.7%	36 new observations	new observations only
direct transfer with consent	44.5%	42.0%	40 new observations	recode of two observations
fund-to-fund purchase	30.9%	57.2%	54 new observations	new observations only
no secondary observed	55.5%	21.3%	96 new observations	correction to a prior edition

8. Trend analysis and composition change

Under the treatment adopted here, an analyst recoding a secondary structure observation must record the alternative, because the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. The share reported for fund-to-fund purchase is 21.7%, from 179 observations in a denominator of 823, and company-run tender is measured on that denominator so neither absorbs the other's cases. As a practical matter, geographic coverage for secondary structure is strongest in DACH and is reported as thin elsewhere.

Measured over the whole window, two provisions in tension over secondary structure are resolved by the coding rule rather than by judgement, and the same company appearing in two financings contributes two observations only where both fall inside the measurement window. Applied to direct transfer with consent, that gives 162 observations against a usable denominator of 823, or 19.7%; the comparison against direct transfer with consent rests on the same denominator, so the variants remain additive within the secondary structure partition. By the same token, where logistics software observations are thin, the secondary structure share is reported with its count rather than as a percentage alone.

Taken at the population level, trend commentary on secondary transactions and tenders separates a movement in terms from a movement in the sample, and an observation excluded on review keeps its exclusion reason in the register, so the screen can be audited rather than trusted. The share reported for direct transfer with consent is 19.7%, from 162 observations in a denominator of 823, and company-run tender is measured on that denominator so neither absorbs the other's cases. The publisher notes that geographic coverage for secondary structure is strongest in US Midwest and is reported as thin elsewhere.

In the publisher's own terms, trend commentary on secondary transactions and tenders separates a movement in terms from a movement in the sample, and an instrument obtained after the edition closed is held for the next edition rather than folded into a published table. For direct transfer with consent the register yields 162 observations, 19.7% of the 823 that disclose secondary structure, and the adjacent row for company-run tender is computed identically. One consequence is that only where a filed instrument established it is the over $50m revenue band applied to secondary structure.

9. Sensitivity to missing data

On a strict reading of the screen, silence about secondary structure is not a negative observation here: the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. company-run tender accounts for 16 of the 823 disclosing observations, 1.9% of them, and no secondary observed is tabulated on that identical base rather than on the wider population. One consequence is that where logistics software observations are thin, the secondary structure share is reported with its count rather than as a percentage alone.

For a reader auditing the screen, definitions governing secondary structure are stated before any figure is reported, since no figure here rests on a single unverified secondary source without that being visible in the source tier column. Counting only disclosing observations, direct transfer with consent reaches 19.7%, being 162 of 823; the figure for direct transfer with consent shares that denominator and no observation is counted twice between them. It follows that instruments bearing on secondary structure came from 134 contributing firms for this edition.

Looking across the window, segment cuts of secondary structure describe the observed sample only, and no figure here rests on a single unverified secondary source without that being visible in the source tier column. 162 observations were coded direct transfer with consent, giving 19.7% against the 823 disclosing this field; direct transfer with consent is reported beside it on the same base for comparability. Worth stating plainly: only where a filed instrument established it is the $20m to $50m revenue band applied to secondary structure.

In the publisher's own terms, source tiering governs what may be asserted about secondary structure, so a reader needing the underlying instrument can identify it from the register reference without asking the publisher for the file. Counting only disclosing observations, no secondary observed reaches 56.6%, being 466 of 823; the figure for company-run tender shares that denominator and no observation is counted twice between them. The working papers add that the screen for this volume reads: financings whose transfer consents or tender documents were obtained, measured over the window to 31 March 2026.

10. Comparison with the prior edition

Before any tabulation, this volume treats secondary transactions and tenders as its measured field, and a reader needing the underlying instrument can identify it from the register reference without asking the publisher for the file. For fund-to-fund purchase the register yields 179 observations, 21.7% of the 823 that disclose secondary structure, and the adjacent row for direct transfer with consent is computed identically. By the same token, where supply-chain analytics observations are thin, the secondary structure share is reported with its count rather than as a percentage alone.

Turning to the register, an observation contributes to secondary transactions and tenders once only, and a term recorded as undisclosed is withheld from the denominator, the only treatment consistent with the disclosure rate printed beside it. Counting only disclosing observations, direct transfer with consent reaches 19.7%, being 162 of 823; the figure for company-run tender shares that denominator and no observation is counted twice between them. The publisher notes that instruments bearing on secondary structure came from 128 contributing firms for this edition.

As recorded in the decision log, composition of the secondary transactions and tenders sample changes between editions, and no figure here rests on a single unverified secondary source without that being visible in the source tier column. Counting only disclosing observations, fund-to-fund purchase reaches 21.7%, being 179 of 823; the figure for direct transfer with consent shares that denominator and no observation is counted twice between them. The composition tables show that observations sourced from a unverified secondary are admitted for secondary structure but marked so in the source tier column.

For a reader auditing the screen, two provisions in tension over secondary structure are resolved by the coding rule rather than by judgement, and the count admitted under the screen is stated in the register caption and is never adjusted afterwards to improve a result. For no secondary observed the register yields 466 observations, 56.6% of the 823 that disclose secondary structure, and the adjacent row for direct transfer with consent is computed identically. It bears noting that within Growth the secondary structure partition is reported separately, because its disclosure rate differs from the population rate.

Table 12.3 - secondary transactions and tenders distribution by stage, with documented outliers

Stage within the secondary population	n	Minimum	25th percentile	Median	75th percentile	Maximum	Outliers
Series A	93	$14,000,000	$23,000,000	$30,000,000	$44,000,000	$53,000,000	0
Series B	195	$27,000,000	$32,000,000	$44,000,000	$61,000,000	$83,000,000	3
Series C	187	$28,000,000	$37,000,000	$50,000,000	$69,000,000	$108,000,000	1
Series D and later	216	$17,000,000	$22,000,000	$31,000,000	$39,000,000	$60,000,000	0
Growth	61	$22,000,000	$26,000,000	$34,000,000	$54,000,000	$69,000,000	0

11. Limitations

Taken at the population level, sensitivity analysis reruns each secondary structure share under alternative treatments, and the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. Counting only disclosing observations, direct transfer with consent reaches 19.7%, being 162 of 823; the figure for fund-to-fund purchase shares that denominator and no observation is counted twice between them. The register records that the screen for this volume reads: financings whose transfer consents or tender documents were obtained, measured over the window to 31 March 2026.

Turning to the register, segment cuts of secondary structure describe the observed sample only, and a term recorded as undisclosed is withheld from the denominator, the only treatment consistent with the disclosure rate printed beside it. Reading the secondary structure partition row by row, no secondary observed carries 466 observations and 56.6%, measured against 823; the fund-to-fund purchase row is additive with it. A related point: where warehouse automation observations are thin, the secondary structure share is reported with its count rather than as a percentage alone.

In this volume's presentation, this volume treats secondary transactions and tenders as its measured field, and the measurement window is fixed at the edition date, and observations are not backfilled once the edition has been published. For company-run tender the register yields 16 observations, 1.9% of the 823 that disclose secondary structure, and the adjacent row for direct transfer with consent is computed identically. A qualification applies here: instruments bearing on secondary structure came from 118 contributing firms for this edition.

As between the variants, the population underlying secondary transactions and tenders was fixed before any secondary structure figure was computed, because an instrument obtained after the edition closed is held for the next edition rather than folded into a published table. For direct transfer with consent the register yields 162 observations, 19.7% of the 823 that disclose secondary structure, and the adjacent row for fund-to-fund purchase is computed identically. The composition tables show that observations sourced from a contemporaneous press report are admitted for secondary structure but marked so in the source tier column.

12. Definitions

Before any tabulation, limitations recorded for secondary structure bear directly on how far its shares travel: the screen is stated in full, so a reader who disagrees with it can identify which observations their own screen would drop. The share reported for company-run tender is 1.9%, from 16 observations in a denominator of 823, and direct transfer with consent is measured on that denominator so neither absorbs the other's cases. The register records that within Series D and later the secondary structure partition is reported separately, because its disclosure rate differs from the population rate.

With the register open alongside, sensitivity analysis reruns each secondary structure share under alternative treatments, and quartile spread carries information a mean conceals, particularly where a handful of financings sit far from the centre of the distribution. 162 observations were coded direct transfer with consent, giving 19.7% against the 823 disclosing this field; direct transfer with consent is reported beside it on the same base for comparability. Set against that, where warehouse automation observations are thin, the secondary structure share is reported with its count rather than as a percentage alone.

At the level of the individual instrument, contributing firms supply instruments bearing on secondary structure rather than summaries of them, and an instrument obtained after the edition closed is held for the next edition rather than folded into a published table. direct transfer with consent accounts for 162 of the 823 disclosing observations, 19.7% of

them, and direct transfer with consent is tabulated on that identical base rather than on the wider population. Against that background, observations sourced from a counsel-confirmed summary are admitted for secondary structure but marked so in the source tier column.

Read against the prior edition, denominators for secondary structure rest on the disclosing subset alone, which means a change since the prior edition is attributed to new observations, to a recode, or to a correction, and never left unexplained. Applied to company-run tender, that gives 16 observations against a usable denominator of 823, or 1.9%; the comparison against direct transfer with consent rests on the same denominator, so the variants remain additive within the secondary structure partition. In the same connection, instruments bearing on secondary structure came from 135 contributing firms for this edition.
