MARKET SURVEY STATISTICAL APPENDIX - RECORD 013

Helioscope Robotics, Inc. - diligence file reference MARKET_APPENDICES-013

1. Research question and scope

Kessler Ward Research publishes this volume on dividend, redemption and registration rights alongside the term survey covering financings from 1 July 2023 to 31 March 2026. It asks how often accruing dividends, redemption rights and demand registration appear, over 1,238 admitted observations of which 1,114 disclose ancillary right. The screen admitting them reads: financings whose charter and rights agreement were both obtained.

So far as disclosure permits, because instruments disclose ancillary right unevenly, the tier an observation came from constrains what this appendix will assert about it, and that constraint is printed rather than assumed. Reading the ancillary right partition row by row, demand registration carries 78 observations and 7.0%, measured against 1,114; the non-cumulative dividend only row is additive with it. A related point: for the 2024 Q4 sub-period the ancillary right count is published with its own denominator rather than folded into the annual figure.

On a strict reading of the screen, readers comparing this edition's ancillary right tables with the prior edition should note that the screen is stated in full, so a reader who disagrees with it can identify which observations their own screen would drop. The share reported for redemption right is 29.0%, from 323 observations in a denominator of 1,114, and accruing dividend is measured on that denominator so neither absorbs the other's cases. It follows that observations sourced from a executed instrument are admitted for ancillary right but marked so in the source tier column.

As the screen was applied, two provisions in tension over ancillary right are resolved by the coding rule rather than by judgement, and the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. 323 observations were coded redemption right, giving 29.0% against the 1,114 disclosing this field; redemption right is reported beside it on the same base for comparability. On the same evidence, the screen for this volume reads: financings whose charter and rights agreement were both obtained, measured over the window to 31 March 2026.

Turning to the register, outliers in the dividend, redemption and registration rights tables are retained and documented rather than trimmed, which means the published share and the composition-adjusted share appear side by side, and where they diverge the attribution column says which. Reading the ancillary right partition row by row, none of these carries 258 observations and 23.2%, measured against 1,114; the redemption right row is additive with it. The working papers add that instruments bearing on ancillary right came from 133 contributing firms for this edition.

Register 13.1 - observations screened for the dividend, redemption and registration rights population (1,238 admitted)

1. Research question and scope - part 2 of 3

Where the 1. Research question and scope was interrupted by the page, it picks up again below, and the numbering is continuous throughout the schedule.

Definitions given once for the 1. Research question and scope are relied on again rather than restated, the compilation basis being identical. No row is omitted at the join.

Register 13.1 - observations screened for the dividend, redemption and registration rights population (1,238 admitted) (continued, part 2 of 3)

1. Research question and scope - part 3 of 3

Below, the 1. Research question and scope continues; nothing separates this part from the last except the page on which it happens to fall. The sequence is unbroken either side of it.

Readers should carry the 1. Research question and scope's stated conventions across the break, since this part adds no definition of its own. Pagination alone determines where it falls.

Register 13.1 - observations screened for the dividend, redemption and registration rights population (1,238 admitted) (continued, part 3 of 3)

2. Population definition and screen

Under the treatment adopted here, research design for ancillary right begins from the population rather than the tabulation, because an observation excluded on review keeps its exclusion reason in the register, so the screen can be audited rather than trusted. Reading the ancillary right partition row by row, demand registration carries 78 observations and 7.0%, measured against 1,114; the non-cumulative dividend only row is additive with it. It follows that within Series A the ancillary right partition is reported separately, because its disclosure rate differs from the population rate.

So far as disclosure permits, readers comparing this edition's ancillary right tables with the prior edition should note that a change since the prior edition is attributed to new observations, to a recode, or to a correction, and never left unexplained. Counting only disclosing observations, demand registration reaches 7.0%, being 78 of 1,114; the figure for none of these shares that denominator and no observation is counted twice between them. Against that background, instruments bearing on ancillary right came from 121 contributing firms for this edition.

Framed as a research question, definitions governing ancillary right are stated before any figure is reported, since an instrument obtained after the edition closed is held for the next edition rather than folded into a published table. The ancillary right partition puts 258 observations under none of these and reports 23.2% on a denominator of 1,114; non-cumulative dividend only is drawn from the same base so the two shares may be added. A qualification applies here: only where a filed instrument established it is the over $50m revenue band applied to ancillary right.

Considered field by field, the population underlying dividend, redemption and registration rights was fixed before any ancillary right figure was computed, because the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. The ancillary right partition puts 258 observations under none of these and reports 23.2% on a denominator of 1,114; demand registration is drawn from the same base so the two shares may be added. Worth stating plainly: only where a filed instrument established it is the $2m to $8m revenue band applied to ancillary right.

3. Source hierarchy and admissibility

Set beside the composition tables, outliers in the dividend, redemption and registration rights tables are retained and documented rather than trimmed, which means the count admitted under the screen is stated in the register caption and is never adjusted afterwards to improve a result. The share reported for redemption right is 29.0%, from 323 observations in a denominator of 1,114, and redemption right is measured on that denominator so neither absorbs the other's cases. In the same connection, instruments bearing on ancillary right came from 110 contributing firms for this edition.

On a strict reading of the screen, limitations recorded for ancillary right bear directly on how far its shares travel: quartile spread carries information a mean conceals, particularly where a handful of financings sit far from the centre of the distribution. 333 observations were coded accruing dividend, giving 29.9% against the 1,114 disclosing this field; demand registration is reported beside it on the same base for comparability. It bears noting that where fleet telematics observations are thin, the ancillary right share is reported with its count rather than as a percentage alone.

In the analyst's working notes, any engagement's own transaction is excluded from the dividend, redemption and registration rights comparison population, so the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. For accruing dividend the register yields 333 observations, 29.9% of the 1,114 that disclose ancillary right, and the adjacent row for non-cumulative dividend only is computed identically. The register records that geographic coverage for ancillary right is strongest in DACH and is reported as thin elsewhere.

Looking across the window, quartiles rather than means are published for dividend, redemption and registration rights, since the disclosing subset is smaller than the population, and reporting against the population would overstate how often the term is absent. The ancillary right partition puts 122 observations under non-cumulative dividend only and reports 11.0% on a denominator of 1,114; demand registration is drawn from the same base so the two shares may be added. It bears noting that only where a filed instrument established it is the under $2m revenue band applied to ancillary right.

4. Coding rules for ambiguous instruments

Taken at the population level, field-level disclosure rates for ancillary right are published beside every share, so the published share and the composition-adjusted share appear side by side, and where they diverge the attribution column says which. 333 observations were coded accruing dividend, giving 29.9% against the 1,114 disclosing this field; non-cumulative dividend only is reported beside it on the same base for comparability. It bears noting that where manufacturing software observations are thin, the ancillary right share is reported with its count rather than as a percentage alone.

Looking across the window, field-level disclosure rates for ancillary right are published beside every share, so a change since the prior edition is attributed to new observations, to a recode, or to a correction, and never left unexplained. Counting only disclosing observations, none of these reaches 23.2%, being 258 of 1,114; the figure for accruing dividend shares that denominator and no observation is counted twice between them. Against that background, observations sourced from a counsel-confirmed summary are admitted for ancillary right but marked so in the source tier column.

For a reader auditing the screen, an observation contributes to dividend, redemption and registration rights once only, and an observation excluded on review keeps its exclusion reason in the register, so the screen can be audited rather than trusted. 333 observations were coded accruing dividend, giving 29.9% against the 1,114 disclosing this field; demand registration is reported beside it on the same base for comparability. The register records that instruments bearing on ancillary right came from 133 contributing firms for this edition.

As recorded in the decision log, readers comparing this edition's ancillary right tables with the prior edition should note that the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. The ancillary right partition puts 333 observations under accruing dividend and reports 29.9% on a denominator of 1,114; non-cumulative dividend only is drawn from the same base so the two shares may be added. One consequence is that geographic coverage for ancillary right is strongest in Nordics and is reported as thin elsewhere.

Table 13.2 - ancillary right frequency on a usable denominator of 1,114

Ancillary right	Observations	Usable denominator	Share of usable	Prior edition share	Movement
accruing dividend	333	1,114	29.9%	3.9%	+26.0 pp
non-cumulative dividend only	122	1,114	11.0%	24.1%	-13.1 pp
redemption right	323	1,114	29.0%	25.2%	+3.8 pp
demand registration	78	1,114	7.0%	30.1%	-23.1 pp
none of these	258	1,114	23.2%	16.8%	+6.4 pp
not disclosed (excluded from denominator)	124	1,238	10.0%	-	-

5. Disclosure treatment and denominators

The screen for dividend, redemption and registration rights admits 1,238 observations, of which 124 say nothing about ancillary right, a disclosure rate of 90.0%. The 124 silent observations remain in the register for composition purposes and are withheld from every ancillary right denominator, which is why the two counts differ throughout.

Taken at the population level, because instruments disclose ancillary right unevenly, an instrument obtained after the edition closed is held for the next edition rather than folded into a published table. accruing dividend accounts for 333 of the 1,114 disclosing observations, 29.9% of them, and non-cumulative dividend only is tabulated on that identical base rather than on the wider population. The reviewer also recorded that where supply-chain analytics observations are thin, the ancillary right share is reported with its count rather than as a percentage alone.

As the screen was applied, readers comparing this edition's ancillary right tables with the prior edition should note that the count admitted under the screen is stated in the register caption and is never adjusted afterwards to improve a result. Counting only disclosing observations, none of these reaches 23.2%, being 258 of 1,114; the figure for demand registration shares that denominator and no observation is counted twice between them. The methodology note adds that where autonomous systems observations are thin, the ancillary right share is reported with its count rather than as a percentage alone.

As a matter of coding, contributing firms supply instruments bearing on ancillary right rather than summaries of them, and the same company appearing in two financings contributes two observations only where both fall inside the measurement window. The share reported for demand registration is 7.0%, from 78 observations in a denominator of 1,114, and none of these is measured on that denominator so neither absorbs the other's cases. Against that background, for the 2023 Q4 sub-period the ancillary right count is published with its own denominator rather than folded into the annual figure.

In the publisher's own terms, an observation contributes to dividend, redemption and registration rights once only, and quartile spread carries information a mean conceals, particularly where a handful of financings sit far from the centre of the distribution. Counting only disclosing observations, redemption right reaches 29.0%, being 323 of 1,114; the figure for none of these shares that denominator and no observation is counted twice between them. For completeness, observations sourced from a unverified secondary are admitted for ancillary right but marked so in the source tier column.

6. Reported distributions

Taken at the population level, limitations recorded for ancillary right bear directly on how far its shares travel: the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. The ancillary right partition puts 333 observations under accruing dividend and reports 29.9% on a denominator of 1,114; accruing dividend is drawn from the same base so the two shares may be added. Against that background, only where a filed instrument established it is the $2m to $8m revenue band applied to ancillary right.

By way of scope, where dividend, redemption and registration rights is concerned the screen admits an observation only when an instrument obtained after the edition closed is held for the next edition rather than folded into a published table. Applied to demand registration, that gives 78 observations against a usable denominator of 1,114, or 7.0%; the comparison against demand registration rests on the same denominator, so the variants remain additive within the ancillary right partition. For completeness, instruments bearing on ancillary right came from 118 contributing firms for this edition.

Looking across the window, contributing firms supply instruments bearing on ancillary right rather than summaries of them, and quartile spread carries information a mean conceals, particularly where a handful of financings sit far from the centre of the distribution. Reading the ancillary right partition row by row, demand registration carries 78 observations and 7.0%, measured against 1,114; the redemption right row is additive with it. On the same evidence, where machine vision observations are thin, the ancillary right share is reported with its count rather than as a percentage alone.

Looking across the window, an analyst recoding a ancillary right observation must record the alternative, because the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. The share reported for redemption right is 29.0%, from 323 observations in a denominator of 1,114, and accruing dividend is measured on that denominator so neither absorbs the other's cases. The register records that within Series B the ancillary right partition is reported separately, because its disclosure rate differs from the population rate.

6. Reported distributions - part 2 of 3

Presentation of the 6. Reported distributions carries on below without restarting the row numbers, the break being one of pagination only. No row is omitted at the join.

Everything stated about how the 6. Reported distributions was assembled continues to hold, and the break carries no substantive meaning. Pagination alone determines where it falls.

Register 13.1 - observations screened for the dividend, redemption and registration rights population (1,238 admitted) (continued, part 2 of 3)

7. Segment cuts

For a reader auditing the screen, any engagement's own transaction is excluded from the dividend, redemption and registration rights comparison population, so a term recorded as undisclosed is withheld from the denominator, the only treatment consistent with the disclosure rate printed beside it. For demand registration the register yields 78 observations, 7.0% of the 1,114 that disclose ancillary right, and the adjacent row for none of these is computed identically. It follows that where supply-chain analytics observations are thin, the ancillary right share is reported with its count rather than as a percentage alone.

For the avoidance of doubt, outliers in the dividend, redemption and registration rights tables are retained and documented rather than trimmed, which means no figure here rests on a single unverified secondary source without that being visible in the source tier column. Counting only disclosing observations, non-cumulative dividend only reaches 11.0%, being 122 of 1,114; the figure for redemption right shares that denominator and no observation is counted twice between them. The publisher notes that instruments bearing on ancillary right came from 116 contributing firms for this edition.

In the publisher's own terms, trend commentary on dividend, redemption and registration rights separates a movement in terms from a movement in the sample, and the same company appearing in two financings contributes two observations only where both fall inside the measurement window. Reading the ancillary right partition row by row, redemption right carries 323 observations and 29.0%, measured against 1,114; the accruing dividend row is additive with it. The reviewer also recorded that instruments bearing on ancillary right came from 134 contributing firms for this edition.

As a matter of coding, two provisions in tension over ancillary right are resolved by the coding rule rather than by judgement, and the count admitted under the screen is stated in the register caption and is never adjusted afterwards to improve a result. non-cumulative dividend only accounts for 122 of the 1,114 disclosing observations, 11.0% of them, and accruing dividend is tabulated on that identical base rather than on the wider population. One consequence is that within Series D and later the ancillary right partition is reported separately, because its disclosure rate differs from the population rate.

Table 13.3 - dividend, redemption and registration rights distribution by stage, with documented outliers

Stage within the ancillary population	n	Minimum	25th percentile	Median	75th percentile	Maximum	Outliers
Series A	194	$9,000,000	$21,000,000	$29,000,000	$35,000,000	$49,000,000	3
Series B	195	$13,000,000	$19,000,000	$27,000,000	$40,000,000	$74,000,000	2
Series C	243	$28,000,000	$34,000,000	$42,000,000	$51,000,000	$66,000,000	3
Series D and later	192	$27,000,000	$37,000,000	$48,000,000	$57,000,000	$87,000,000	3
Growth	84	$21,000,000	$33,000,000	$38,000,000	$44,000,000	$85,000,000	0

8. Trend analysis and composition change

By way of scope, coding practice for ancillary right departs from loose market usage, in that the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. Reading the ancillary right partition row by row, none of these carries 258 observations and 23.2%, measured against 1,114; the redemption right row is additive with it. On the same evidence, within Series C the ancillary right partition is reported separately, because its disclosure rate differs from the population rate.

Put in terms of denominators, outliers in the dividend, redemption and registration rights tables are retained and documented rather than trimmed, which means the measurement window is fixed at the edition date, and observations are not backfilled once the edition has been published. Applied to redemption right, that gives 323 observations against a usable denominator of 1,114, or 29.0%; the comparison against none of these rests on the same denominator, so the

variants remain additive within the ancillary right partition. Equally, only where a filed instrument established it is the over $50m revenue band applied to ancillary right.

For a reader auditing the screen, quartiles rather than means are published for dividend, redemption and registration rights, since no figure here rests on a single unverified secondary source without that being visible in the source tier column. For demand registration the register yields 78 observations, 7.0% of the 1,114 that disclose ancillary right, and the adjacent row for demand registration is computed identically. Worth stating plainly: observations sourced from a unverified secondary are admitted for ancillary right but marked so in the source tier column.

Turning to the register, two provisions in tension over ancillary right are resolved by the coding rule rather than by judgement, and an observation excluded on review keeps its exclusion reason in the register, so the screen can be audited rather than trusted. For none of these the register yields 258 observations, 23.2% of the 1,114 that disclose ancillary right, and the adjacent row for demand registration is computed identically. It follows that observations sourced from a unverified secondary are admitted for ancillary right but marked so in the source tier column.

9. Sensitivity to missing data

By way of scope, an observation contributes to dividend, redemption and registration rights once only, and a reader needing the underlying instrument can identify it from the register reference without asking the publisher for the file. 258 observations were coded none of these, giving 23.2% against the 1,114 disclosing this field; non-cumulative dividend only is reported beside it on the same base for comparability. A related point: only where a filed instrument established it is the over $50m revenue band applied to ancillary right.

Against the source hierarchy, segment cuts of ancillary right describe the observed sample only, and quartile spread carries information a mean conceals, particularly where a handful of financings sit far from the centre of the distribution. The ancillary right partition puts 333 observations under accruing dividend and reports 29.9% on a denominator of 1,114; redemption right is drawn from the same base so the two shares may be added. A related point: observations sourced from a unverified secondary are admitted for ancillary right but marked so in the source tier column.

Framed as a research question, silence about ancillary right is not a negative observation here: the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. Counting only disclosing observations, none of these reaches 23.2%, being 258 of 1,114; the figure for demand registration shares that denominator and no observation is counted twice between them. It follows that where supply-chain analytics observations are thin, the ancillary right share is reported with its count rather than as a percentage alone.

In this volume's presentation, any engagement's own transaction is excluded from the dividend, redemption and registration rights comparison population, so the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. Counting only disclosing observations, none of these reaches 23.2%, being 258 of 1,114; the figure for non-cumulative dividend only shares that denominator and no observation is counted twice between them. The composition tables show that where logistics software observations are thin, the ancillary right share is reported with its count rather than as a percentage alone.

10. Comparison with the prior edition

At the level of the individual instrument, silence about ancillary right is not a negative observation here: a term recorded as undisclosed is withheld from the denominator, the only treatment consistent with the disclosure rate printed beside it. Reading the ancillary right partition row by row, redemption right carries 323 observations and 29.0%, measured against 1,114; the accruing dividend row is additive with it. In the same connection, observations sourced from a unverified secondary are admitted for ancillary right but marked so in the source tier column.

Put in terms of denominators, two provisions in tension over ancillary right are resolved by the coding rule rather than by judgement, and a change since the prior edition is attributed to new observations, to a recode, or to a correction, and never left unexplained. Reading the ancillary right partition row by row, none of these carries 258 observations and 23.2%, measured against 1,114; the non-cumulative dividend only row is additive with it. The publisher notes that instruments bearing on ancillary right came from 117 contributing firms for this edition.

Framed as a research question, source tiering governs what may be asserted about ancillary right, so an observation excluded on review keeps its exclusion reason in the register, so the screen can be audited rather than trusted. The ancillary right partition puts 323 observations under redemption right and reports 29.0% on a denominator of 1,114; accruing dividend is drawn from the same base so the two shares may be added. A qualification applies here: within Growth the ancillary right partition is reported separately, because its disclosure rate differs from the population rate.

As the screen was applied, where dividend, redemption and registration rights is concerned the screen admits an observation only when a term recorded as undisclosed is withheld from the denominator, the only treatment consistent with the disclosure rate printed beside it. The share reported for non-cumulative dividend only is 11.0%, from 122 observations in a denominator of 1,114, and redemption right is measured on that denominator so neither absorbs the other's cases. For completeness, the screen for this volume reads: financings whose charter and rights agreement were both obtained, measured over the window to 31 March 2026.

Table 13.4 - dividend, redemption and registration rights cell counts by sector and stage, each cell carrying its own denominator

Sector within the ancillary population	Series A	Series B	Series C	Series D and later	Growth	Row total
industrial robotics	13	31	13	20	30	107
warehouse automation	35	33	34	22	5	129
logistics software	16	17	17	31	4	85
supply-chain analytics	10	30	17	27	5	89
machine vision	27	6	22	10	36	101
autonomous systems	10	4	33	11	22	80
manufacturing software	32	27	12	36	33	140
fleet telematics	25	29	25	20	22	121
Column total	168	177	173	177	157	852

11. Limitations

In this volume's presentation, limitations recorded for ancillary right bear directly on how far its shares travel: the measurement window is fixed at the edition date, and observations are not backfilled once the edition has been published. The share reported for redemption right is 29.0%, from 323 observations in a denominator of 1,114, and accruing dividend is measured on that denominator so neither absorbs the other's cases. The composition tables show that for the 2024 Q1 sub-period the ancillary right count is published with its own denominator rather than folded into the annual figure.

Taken at the population level, quartiles rather than means are published for dividend, redemption and registration rights, since the same company appearing in two financings contributes two observations only where both fall inside the measurement window. The share reported for none of these is 23.2%, from 258 observations in a denominator of 1,114, and redemption right is measured on that denominator so neither absorbs the other's cases. On the same evidence, observations sourced from a executed instrument are admitted for ancillary right but marked so in the source tier column.

On the methodology, trend commentary on dividend, redemption and registration rights separates a movement in terms from a movement in the sample, and the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. 333 observations were coded accruing dividend, giving 29.9% against the 1,114 disclosing this field; demand registration is reported beside it on the same base for comparability. A qualification applies here: the screen for this volume reads: financings whose charter and rights agreement were both obtained, measured over the window to 31 March 2026.

Set beside the composition tables, silence about ancillary right is not a negative observation here: the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. Reading the ancillary right partition row by row, non-cumulative dividend only carries 122 observations and 11.0%, measured against 1,114; the none of these row is additive with it. By the same token, only where a filed instrument established it is the $20m to $50m revenue band applied to ancillary right.

12. Definitions

Taken at the population level, because instruments disclose ancillary right unevenly, an observation excluded on review keeps its exclusion reason in the register, so the screen can be audited rather than trusted. The share reported for accruing dividend is 29.9%, from 333 observations in a denominator of 1,114, and demand registration is measured on that denominator so neither absorbs the other's cases. A qualification applies here: instruments bearing on ancillary right came from 117 contributing firms for this edition.

In the publisher's own terms, where dividend, redemption and registration rights is concerned the screen admits an observation only when quartile spread carries information a mean conceals, particularly where a handful of financings sit far from the centre of the distribution. Reading the ancillary right partition row by row, demand registration carries 78 observations and 7.0%, measured against 1,114; the none of these row is additive with it. In the same connection, geographic coverage for ancillary right is strongest in Canada and is reported as thin elsewhere.

Before any tabulation, quartiles rather than means are published for dividend, redemption and registration rights, since the screen is stated in full, so a reader who disagrees with it can identify which observations their own screen would drop. The ancillary right partition puts 258 observations under none of these and reports 23.2% on a denominator of 1,114; demand registration is drawn from the same base so the two shares may be added. A related point: instruments bearing on ancillary right came from 117 contributing firms for this edition.

In the publisher's own terms, definitions governing ancillary right are stated before any figure is reported, since the measurement window is fixed at the edition date, and observations are not backfilled once the edition has been published. The share reported for non-cumulative dividend only is 11.0%, from 122 observations in a denominator of 1,114, and demand registration is measured on that denominator so neither absorbs the other's cases. It bears noting that geographic coverage for ancillary right is strongest in UK and Ireland and is reported as thin elsewhere.
