MARKET SURVEY STATISTICAL APPENDIX - RECORD 014

Helioscope Robotics, Inc. - diligence file reference MARKET_APPENDICES-014

1. Research question and scope

Kessler Ward Research publishes this volume on drag-along and co-sale variants alongside the term survey covering financings from 1 July 2023 to 31 March 2026. It asks who can trigger a drag, and what conditions protect the dragged holders, over 1,272 admitted observations of which 1,081 disclose drag trigger. The screen admitting them reads: financings whose voting or co-sale agreement was obtained.

Looking across the window, quartiles rather than means are published for drag-along and co-sale variants, since no figure here rests on a single unverified secondary source without that being visible in the source tier column. The share reported for board plus preferred majority is 0.9%, from 10 observations in a denominator of 1,081, and no drag is measured on that denominator so neither absorbs the other's cases. A qualification applies here: within Series D and later the drag trigger partition is reported separately, because its disclosure rate differs from the population rate.

Set beside the composition tables, the population underlying drag-along and co-sale variants was fixed before any drag trigger figure was computed, because the count admitted under the screen is stated in the register caption and is never adjusted afterwards to improve a result. The drag trigger partition puts 251 observations under common and preferred majorities and reports 23.2% on a denominator of 1,081; no drag is drawn from the same base so the two shares may be added. The methodology note adds that the screen for this volume reads: financings whose voting or co-sale agreement was obtained, measured over the window to 31 March 2026.

Against the source hierarchy, denominators for drag trigger rest on the disclosing subset alone, which means no figure here rests on a single unverified secondary source without that being visible in the source tier column. For no drag the register yields 300 observations, 27.8% of the 1,081 that disclose drag trigger, and the adjacent row for no drag is computed identically. Equally, within Series A the drag trigger partition is reported separately, because its disclosure rate differs from the population rate.

Looking across the window, outliers in the drag-along and co-sale variants tables are retained and documented rather than trimmed, which means the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. The share reported for supermajority of preferred is 28.8%, from 311 observations in a denominator of 1,081, and preferred majority alone is measured on that denominator so neither absorbs the other's cases. By the same token, only where a filed instrument established it is the under $2m revenue band applied to drag trigger.

Register 14.1 - observations screened for the drag-along and co-sale variants population (1,272 admitted)

1. Research question and scope - part 2 of 3

Below, the 1. Research question and scope continues; nothing separates this part from the last except the page on which it happens to fall. Nothing is restated from the earlier part.

The measurement basis recorded when the 1. Research question and scope opened is unchanged, so any figure here is comparable with any figure in the earlier parts.

Register 14.1 - observations screened for the drag-along and co-sale variants population (1,272 admitted) (continued, part 2 of 3)

1. Research question and scope - part 3 of 3

This is part 3 of the 1. Research question and scope, carried over unbroken; a reader reconciling a reference should treat the parts as a single register. The parts are to be read together.

Column definitions stated with the first part of the 1. Research question and scope govern the whole of it, and any qualification recorded there is carried forward here. Nothing is restated from the earlier part.

Register 14.1 - observations screened for the drag-along and co-sale variants population (1,272 admitted) (continued, part 3 of 3)

2. Population definition and screen

Where the sample is thin, source tiering governs what may be asserted about drag trigger, so the count admitted under the screen is stated in the register caption and is never adjusted afterwards to improve a result. Reading the drag trigger partition row by row, no drag carries 300 observations and 27.8%, measured against 1,081; the board plus preferred majority row is additive with it. Worth stating plainly: geographic coverage for drag trigger is strongest in US South and is reported as thin elsewhere.

Measured over the whole window, denominators for drag trigger rest on the disclosing subset alone, which means the same company appearing in two financings contributes two observations only where both fall inside the measurement window. Reading the drag trigger partition row by row, board plus preferred majority carries 10 observations and 0.9%, measured against 1,081; the no drag row is additive with it. A related point: only where a filed instrument established it is the over $50m revenue band applied to drag trigger.

As between the variants, readers comparing this edition's drag trigger tables with the prior edition should note that quartile spread carries information a mean conceals, particularly where a handful of financings sit far from the centre of the distribution. Applied to supermajority of preferred, that gives 311 observations against a usable denominator of 1,081, or 28.8%; the comparison against no drag rests on the same denominator, so the variants remain additive within the drag trigger partition. The methodology note adds that instruments bearing on drag trigger came from 111 contributing firms for this edition.

Before any tabulation, limitations recorded for drag trigger bear directly on how far its shares travel: the measurement window is fixed at the edition date, and observations are not backfilled once the edition has been published. Applied to preferred majority alone, that gives 209 observations against a usable denominator of 1,081, or 19.3%; the comparison against preferred majority alone rests on the same denominator, so the variants remain additive within the drag trigger partition. A qualification applies here: instruments bearing on drag trigger came from 117 contributing firms for this edition.

3. Source hierarchy and admissibility

For a reader auditing the screen, silence about drag trigger is not a negative observation here: the same company appearing in two financings contributes two observations only where both fall inside the measurement window. 10 observations were coded board plus preferred majority, giving 0.9% against the 1,081 disclosing this field; no drag is reported beside it on the same base for comparability. For completeness, for the 2026 Q2 sub-period the drag trigger count is published with its own denominator rather than folded into the annual figure.

In the analyst's working notes, outliers in the drag-along and co-sale variants tables are retained and documented rather than trimmed, which means the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. The drag trigger partition puts 10 observations under board plus preferred majority and reports 0.9% on a denominator of 1,081; preferred majority alone is drawn from the same base so the two shares may be added. For completeness, for the 2025 Q2 sub-period the drag trigger count is published with its own denominator rather than folded into the annual figure.

Where the sample is thin, coding practice for drag trigger departs from loose market usage, in that a term recorded as undisclosed is withheld from the denominator, the only treatment consistent with the disclosure rate printed beside it. Reading the drag trigger partition row by row, preferred majority alone carries 209 observations and 19.3%, measured against 1,081; the common and preferred majorities row is additive with it. Against that background, observations sourced from a executed instrument are admitted for drag trigger but marked so in the source tier column.

Put in terms of denominators, composition of the drag-along and co-sale variants sample changes between editions, and an observation excluded on review keeps its exclusion reason in the register, so the screen can be audited rather than

trusted. 10 observations were coded board plus preferred majority, giving 0.9% against the 1,081 disclosing this field; no drag is reported beside it on the same base for comparability. By the same token, the screen for this volume reads: financings whose voting or co-sale agreement was obtained, measured over the window to 31 March 2026.

4. Coding rules for ambiguous instruments

For the avoidance of doubt, field-level disclosure rates for drag trigger are published beside every share, so the same company appearing in two financings contributes two observations only where both fall inside the measurement window. 209 observations were coded preferred majority alone, giving 19.3% against the 1,081 disclosing this field; supermajority of preferred is reported beside it on the same base for comparability. Equally, geographic coverage for drag trigger is strongest in Nordics and is reported as thin elsewhere.

Looking across the window, segment cuts of drag trigger describe the observed sample only, and the tier an observation came from constrains what this appendix will assert about it, and that constraint is printed rather than assumed. The share reported for supermajority of preferred is 28.8%, from 311 observations in a denominator of 1,081, and common and preferred majorities is measured on that denominator so neither absorbs the other's cases. One consequence is that where warehouse automation observations are thin, the drag trigger share is reported with its count rather than as a percentage alone.

Turning to the register, silence about drag trigger is not a negative observation here: no figure here rests on a single unverified secondary source without that being visible in the source tier column. Counting only disclosing observations, common and preferred majorities reaches 23.2%, being 251 of 1,081; the figure for supermajority of preferred shares that denominator and no observation is counted twice between them. The register records that observations sourced from a unverified secondary are admitted for drag trigger but marked so in the source tier column.

As between the variants, composition of the drag-along and co-sale variants sample changes between editions, and the disclosing subset is smaller than the population, and reporting against the population would overstate how often the term is absent. Reading the drag trigger partition row by row, supermajority of preferred carries 311 observations and 28.8%, measured against 1,081; the preferred majority alone row is additive with it. The composition tables show that geographic coverage for drag trigger is strongest in Nordics and is reported as thin elsewhere.

Table 14.2 - drag trigger frequency on a usable denominator of 1,081

Drag trigger	Observations	Usable denominator	Share of usable	Prior edition share	Movement
board plus preferred majority	10	1,081	0.9%	46.8%	-45.9 pp
preferred majority alone	209	1,081	19.3%	13.6%	+5.7 pp
common and preferred majorities	251	1,081	23.2%	8.7%	+14.5 pp
supermajority of preferred	311	1,081	28.8%	9.7%	+19.1 pp
no drag	300	1,081	27.8%	21.2%	+6.6 pp
not disclosed (excluded from denominator)	191	1,272	15.0%	-	-

5. Disclosure treatment and denominators

1,081 instruments in this population speak to drag trigger and 191 do not, a disclosure rate of 85.0%. No table in this volume divides by 1,272. Doing so would credit the silent observations with an absence of drag trigger that no instrument supports.

In this volume's presentation, silence about drag trigger is not a negative observation here: the tier an observation came from constrains what this appendix will assert about it, and that constraint is printed rather than assumed. The drag trigger partition puts 300 observations under no drag and reports 27.8% on a denominator of 1,081; board plus preferred majority is drawn from the same base so the two shares may be added. A related point: instruments bearing on drag trigger came from 136 contributing firms for this edition.

Under the treatment adopted here, an observation contributes to drag-along and co-sale variants once only, and the count admitted under the screen is stated in the register caption and is never adjusted afterwards to improve a result. 300

observations were coded no drag, giving 27.8% against the 1,081 disclosing this field; preferred majority alone is reported beside it on the same base for comparability. It bears noting that observations sourced from a counsel-confirmed summary are admitted for drag trigger but marked so in the source tier column.

At the level of the individual instrument, this volume treats drag-along and co-sale variants as its measured field, and the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. Reading the drag trigger partition row by row, no drag carries 300 observations and 27.8%, measured against 1,081; the no drag row is additive with it. Worth stating plainly: for the 2025 Q1 sub-period the drag trigger count is published with its own denominator rather than folded into the annual figure.

As between the variants, field-level disclosure rates for drag trigger are published beside every share, so the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. Applied to common and preferred majorities, that gives 251 observations against a usable denominator of 1,081, or 23.2%; the comparison against supermajority of preferred rests on the same denominator, so the variants remain additive within the drag trigger partition. Against that background, within Series A the drag trigger partition is reported separately, because its disclosure rate differs from the population rate.

6. Reported distributions

On the methodology, quartiles rather than means are published for drag-along and co-sale variants, since the screen is stated in full, so a reader who disagrees with it can identify which observations their own screen would drop. 311 observations were coded supermajority of preferred, giving 28.8% against the 1,081 disclosing this field; no drag is reported beside it on the same base for comparability. Worth stating plainly: for the 2024 Q4 sub-period the drag trigger count is published with its own denominator rather than folded into the annual figure.

As a matter of coding, limitations recorded for drag trigger bear directly on how far its shares travel: the same company appearing in two financings contributes two observations only where both fall inside the measurement window. 251 observations were coded common and preferred majorities, giving 23.2% against the 1,081 disclosing this field; common and preferred majorities is reported beside it on the same base for comparability. The working papers add that observations sourced from a unverified secondary are admitted for drag trigger but marked so in the source tier column.

In this volume's presentation, source tiering governs what may be asserted about drag trigger, so the published share and the composition-adjusted share appear side by side, and where they diverge the attribution column says which. For board plus preferred majority the register yields 10 observations, 0.9% of the 1,081 that disclose drag trigger, and the adjacent row for board plus preferred majority is computed identically. In the same connection, for the 2024 Q4 sub-period the drag trigger count is published with its own denominator rather than folded into the annual figure.

In the analyst's working notes, because instruments disclose drag trigger unevenly, quartile spread carries information a mean conceals, particularly where a handful of financings sit far from the centre of the distribution. The drag trigger partition puts 209 observations under preferred majority alone and reports 19.3% on a denominator of 1,081; no drag is drawn from the same base so the two shares may be added. It bears noting that observations sourced from a state or agency filing are admitted for drag trigger but marked so in the source tier column.

6. Reported distributions - part 2 of 3

Following on directly, these further rows of the 6. Reported distributions belong to the same schedule and share its numbering. Nothing is restated from the earlier part.

Treat the conventions declared for the 6. Reported distributions as governing here too; this part introduces none of its own. Pagination alone determines where it falls.

Register 14.1 - observations screened for the drag-along and co-sale variants population (1,272 admitted) (continued, part 2 of 3)

7. Segment cuts

Judged by the disclosure rate, contributing firms supply instruments bearing on drag trigger rather than summaries of them, and the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. 209 observations were coded preferred majority alone, giving 19.3% against the 1,081 disclosing this field; preferred majority alone is reported beside it on the same base for comparability. For completeness, where industrial robotics observations are thin, the drag trigger share is reported with its count rather than as a percentage alone.

For a reader auditing the screen, two provisions in tension over drag trigger are resolved by the coding rule rather than by judgement, and the screen is stated in full, so a reader who disagrees with it can identify which observations their own screen would drop. Reading the drag trigger partition row by row, supermajority of preferred carries 311 observations and 28.8%, measured against 1,081; the common and preferred majorities row is additive with it. A qualification applies here: instruments bearing on drag trigger came from 117 contributing firms for this edition.

Considered field by field, definitions governing drag trigger are stated before any figure is reported, since the same company appearing in two financings contributes two observations only where both fall inside the measurement window. The drag trigger partition puts 209 observations under preferred majority alone and reports 19.3% on a denominator of 1,081; common and preferred majorities is drawn from the same base so the two shares may be added. The working papers add that for the 2023 Q2 sub-period the drag trigger count is published with its own denominator rather than folded into the annual figure.

As recorded in the decision log, source tiering governs what may be asserted about drag trigger, so the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. For common and preferred majorities the register yields 251 observations, 23.2% of the 1,081 that disclose drag trigger, and the adjacent row for supermajority of preferred is computed identically. The composition tables show that geographic coverage for drag trigger is strongest in US Midwest and is reported as thin elsewhere.

Table 14.3 - drag-along and co-sale variants distribution by stage, with documented outliers

Stage within the dragalong population	n	Minimum	25th percentile	Median	75th percentile	Maximum	Outliers
Series A	73	$13,000,000	$18,000,000	$29,000,000	$48,000,000	$94,000,000	2
Series B	41	$10,000,000	$16,000,000	$26,000,000	$37,000,000	$78,000,000	3
Series C	191	$28,000,000	$38,000,000	$49,000,000	$62,000,000	$91,000,000	2
Series D and later	142	$15,000,000	$23,000,000	$27,000,000	$45,000,000	$78,000,000	3
Growth	74	$27,000,000	$38,000,000	$49,000,000	$57,000,000	$90,000,000	0

8. Trend analysis and composition change

As the screen was applied, limitations recorded for drag trigger bear directly on how far its shares travel: the screen is stated in full, so a reader who disagrees with it can identify which observations their own screen would drop. Counting only disclosing observations, preferred majority alone reaches 19.3%, being 209 of 1,081; the figure for no drag shares that denominator and no observation is counted twice between them. For completeness, within Series C the drag trigger partition is reported separately, because its disclosure rate differs from the population rate.

Judged by the disclosure rate, an analyst recoding a drag trigger observation must record the alternative, because the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. The share reported for supermajority of preferred is 28.8%, from 311 observations in a denominator of 1,081, and no drag is measured on that denominator so neither absorbs the other's cases. Against that background, within Series D and later the drag trigger partition is reported separately, because its disclosure rate differs from the population rate.

By way of scope, the population underlying drag-along and co-sale variants was fixed before any drag trigger figure was computed, because the disclosing subset is smaller than the population, and reporting against the population would overstate how often the term is absent. common and preferred majorities accounts for 251 of the 1,081 disclosing observations, 23.2% of them, and no drag is tabulated on that identical base rather than on the wider population. The register records that geographic coverage for drag trigger is strongest in US Midwest and is reported as thin elsewhere.

Put in terms of denominators, an observation contributes to drag-along and co-sale variants once only, and the count admitted under the screen is stated in the register caption and is never adjusted afterwards to improve a result. The share reported for preferred majority alone is 19.3%, from 209 observations in a denominator of 1,081, and no drag is measured on that denominator so neither absorbs the other's cases. The publisher notes that within Series D and later the drag trigger partition is reported separately, because its disclosure rate differs from the population rate.

9. Sensitivity to missing data

Considered field by field, segment cuts of drag trigger describe the observed sample only, and quartile spread carries information a mean conceals, particularly where a handful of financings sit far from the centre of the distribution. Reading the drag trigger partition row by row, preferred majority alone carries 209 observations and 19.3%, measured against 1,081; the supermajority of preferred row is additive with it. A qualification applies here: for the 2025 Q1 sub-period the drag trigger count is published with its own denominator rather than folded into the annual figure.

As the screen was applied, where drag-along and co-sale variants is concerned the screen admits an observation only when a term recorded as undisclosed is withheld from the denominator, the only treatment consistent with the disclosure rate printed beside it. board plus preferred majority accounts for 10 of the 1,081 disclosing observations, 0.9% of them, and no drag is tabulated on that identical base rather than on the wider population. Set against that, where fleet telematics observations are thin, the drag trigger share is reported with its count rather than as a percentage alone.

On the methodology, coding practice for drag trigger departs from loose market usage, in that the count admitted under the screen is stated in the register caption and is never adjusted afterwards to improve a result. 209 observations were coded preferred majority alone, giving 19.3% against the 1,081 disclosing this field; no drag is reported beside it on the same base for comparability. On the same evidence, only where a filed instrument established it is the $2m to $8m revenue band applied to drag trigger.

As a matter of coding, coding practice for drag trigger departs from loose market usage, in that an instrument obtained after the edition closed is held for the next edition rather than folded into a published table. For board plus preferred majority the register yields 10 observations, 0.9% of the 1,081 that disclose drag trigger, and the adjacent row for preferred majority alone is computed identically. In the same connection, geographic coverage for drag trigger is strongest in US Northeast and is reported as thin elsewhere.

10. Comparison with the prior edition

Once the exclusions are applied, because instruments disclose drag trigger unevenly, no figure here rests on a single unverified secondary source without that being visible in the source tier column. Applied to common and preferred majorities, that gives 251 observations against a usable denominator of 1,081, or 23.2%; the comparison against common and preferred majorities rests on the same denominator, so the variants remain additive within the drag trigger partition. A related point: for the 2024 Q3 sub-period the drag trigger count is published with its own denominator rather than folded into the annual figure.

Once the exclusions are applied, source tiering governs what may be asserted about drag trigger, so the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. Reading the drag trigger partition row by row, no drag carries 300 observations and 27.8%, measured against

1,081; the board plus preferred majority row is additive with it. On the same evidence, geographic coverage for drag trigger is strongest in US Midwest and is reported as thin elsewhere.

Measured over the whole window, research design for drag trigger begins from the population rather than the tabulation, because the count admitted under the screen is stated in the register caption and is never adjusted afterwards to improve a result. The drag trigger partition puts 311 observations under supermajority of preferred and reports 28.8% on a denominator of 1,081; common and preferred majorities is drawn from the same base so the two shares may be added. The methodology note adds that geographic coverage for drag trigger is strongest in UK and Ireland and is reported as thin elsewhere.

Set beside the composition tables, because instruments disclose drag trigger unevenly, the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. The drag trigger partition puts 251 observations under common and preferred majorities and reports 23.2% on a denominator of 1,081; common and preferred majorities is drawn from the same base so the two shares may be added. The working papers add that the screen for this volume reads: financings whose voting or co-sale agreement was obtained, measured over the window to 31 March 2026.

Table 14.4 - drag-along and co-sale variants cell counts by sector and stage, each cell carrying its own denominator

Sector within the dragalong population	Series A	Series B	Series C	Series D and later	Growth	Row total
industrial robotics	22	5	22	36	11	96
warehouse automation	29	19	7	19	10	84
logistics software	25	30	34	5	12	106
supply-chain analytics	3	9	30	8	8	58
machine vision	22	31	35	35	19	142
autonomous systems	24	15	19	30	4	92
manufacturing software	33	21	16	3	20	93
fleet telematics	28	11	20	34	26	119
Column total	186	141	183	170	110	790

11. Limitations

In the publisher's own terms, trend commentary on drag-along and co-sale variants separates a movement in terms from a movement in the sample, and no figure here rests on a single unverified secondary source without that being visible in the source tier column. supermajority of preferred accounts for 311 of the 1,081 disclosing observations, 28.8% of them, and board plus preferred majority is tabulated on that identical base rather than on the wider population. The methodology note adds that where logistics software observations are thin, the drag trigger share is reported with its count rather than as a percentage alone.

Measured over the whole window, research design for drag trigger begins from the population rather than the tabulation, because the screen is stated in full, so a reader who disagrees with it can identify which observations their own screen would drop. common and preferred majorities accounts for 251 of the 1,081 disclosing observations, 23.2% of them, and board plus preferred majority is tabulated on that identical base rather than on the wider population. It bears noting that observations sourced from a unverified secondary are admitted for drag trigger but marked so in the source tier column.

For the avoidance of doubt, sensitivity analysis reruns each drag trigger share under alternative treatments, and the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. Reading the drag trigger partition row by row, preferred majority alone carries 209 observations and 19.3%, measured against 1,081; the no drag row is additive with it. It follows that where manufacturing software observations are thin, the drag trigger share is reported with its count rather than as a percentage alone.

On a strict reading of the screen, contributing firms supply instruments bearing on drag trigger rather than summaries of them, and a reader needing the underlying instrument can identify it from the register reference without asking the publisher for the file. supermajority of preferred accounts for 311 of the 1,081 disclosing observations, 28.8%

of them, and supermajority of preferred is tabulated on that identical base rather than on the wider population. One consequence is that for the 2026 Q2 sub-period the drag trigger count is published with its own denominator rather than folded into the annual figure.

12. Definitions

Taken at the population level, contributing firms supply instruments bearing on drag trigger rather than summaries of them, and a change since the prior edition is attributed to new observations, to a recode, or to a correction, and never left unexplained. 311 observations were coded supermajority of preferred, giving 28.8% against the 1,081 disclosing this field; board plus preferred majority is reported beside it on the same base for comparability. A qualification applies here: geographic coverage for drag trigger is strongest in Nordics and is reported as thin elsewhere.

As a matter of coding, outliers in the drag-along and co-sale variants tables are retained and documented rather than trimmed, which means the screen is stated in full, so a reader who disagrees with it can identify which observations their own screen would drop. Applied to no drag, that gives 300 observations against a usable denominator of 1,081, or 27.8%; the comparison against no drag rests on the same denominator, so the variants remain additive within the drag trigger partition. A related point: where manufacturing software observations are thin, the drag trigger share is reported with its count rather than as a percentage alone.

Taken at the population level, quartiles rather than means are published for drag-along and co-sale variants, since the disclosing subset is smaller than the population, and reporting against the population would overstate how often the term is absent. Reading the drag trigger partition row by row, common and preferred majorities carries 251 observations and 23.2%, measured against 1,081; the board plus preferred majority row is additive with it. Set against that, observations sourced from a unverified secondary are admitted for drag trigger but marked so in the source tier column.

Framed as a research question, an observation contributes to drag-along and co-sale variants once only, and the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. The drag trigger partition puts 10 observations under board plus preferred majority and reports 0.9% on a denominator of 1,081; common and preferred majorities is drawn from the same base so the two shares may be added. A qualification applies here: within Series A the drag trigger partition is reported separately, because its disclosure rate differs from the population rate.
