MARKET SURVEY STATISTICAL APPENDIX - RECORD 015

Helioscope Robotics, Inc. - diligence file reference MARKET_APPENDICES-015

1. Research question and scope

Kessler Ward Research publishes this volume on geography and sector stratification alongside the term survey covering financings from 1 July 2023 to 31 March 2026. It asks how the observation set distributes across geography and sector, and where it is thin, over 908 admitted observations of which 908 disclose sector classification basis. The screen admitting them reads: all usable observations in the measurement window.

Turning to the register, readers comparing this edition's sector classification basis tables with the prior edition should note that a reader needing the underlying instrument can identify it from the register reference without asking the publisher for the file. For self-description the register yields 432 observations, 47.6% of the 908 that disclose sector classification basis, and the adjacent row for revenue mix is computed identically. A qualification applies here: geographic coverage for sector classification basis is strongest in Canada and is reported as thin elsewhere.

By way of scope, two provisions in tension over sector classification basis are resolved by the coding rule rather than by judgement, and the disclosing subset is smaller than the population, and reporting against the population would overstate how often the term is absent. Applied to primary activity, that gives 62 observations against a usable denominator of 908, or 6.8%; the comparison against revenue mix rests on the same denominator, so the variants remain additive within the sector classification basis partition. By the same token, only where a filed instrument established it is the $20m to $50m revenue band applied to sector classification basis.

In this volume's presentation, because instruments disclose sector classification basis unevenly, the count admitted under the screen is stated in the register caption and is never adjusted afterwards to improve a result. For reclassified on review the register yields 208 observations, 22.9% of the 908 that disclose sector classification basis, and the adjacent row for revenue mix is computed identically. Equally, where warehouse automation observations are thin, the sector classification basis share is reported with its count rather than as a percentage alone.

Framed as a research question, contributing firms supply instruments bearing on sector classification basis rather than summaries of them, and quartile spread carries information a mean conceals, particularly where a handful of financings sit far from the centre of the distribution. Reading the sector classification basis partition row by row, self-description carries 432 observations and 47.6%, measured against 908; the primary activity row is additive with it. A related point: within Series C the sector classification basis partition is reported separately, because its disclosure rate differs from the population rate.

Register 15.1 - observations screened for the geography and sector stratification population (908 admitted)

1. Research question and scope - part 2 of 3

Rows of the 1. Research question and scope resume here, numbered on from the part immediately preceding, so a reference cited once resolves in only one place. No row is omitted at the join.

Treat the conventions declared for the 1. Research question and scope as governing here too; this part introduces none of its own. The parts are to be read together.

Register 15.1 - observations screened for the geography and sector stratification population (908 admitted) (continued, part 2 of 3)

1. Research question and scope - part 3 of 3

Because the 1. Research question and scope does not fit one page, its remainder is set out below under the same references. Nothing is restated from the earlier part.

Because the basis of the 1. Research question and scope is unchanged, figures in this part may be compared directly with those already given. No row is omitted at the join.

Register 15.1 - observations screened for the geography and sector stratification population (908 admitted) (continued, part 3 of 3)

2. Population definition and screen

Measured over the whole window, any engagement's own transaction is excluded from the geography and sector stratification comparison population, so a reader needing the underlying instrument can identify it from the register reference without asking the publisher for the file. primary activity accounts for 62 of the 908 disclosing observations, 6.8% of them, and self-description is tabulated on that identical base rather than on the wider population. By the same token, instruments bearing on sector classification basis came from 127 contributing firms for this edition.

Taken at the population level, limitations recorded for sector classification basis bear directly on how far its shares travel: the disclosing subset is smaller than the population, and reporting against the population would overstate how often the term is absent. The share reported for self-description is 47.6%, from 432 observations in a denominator of 908, and self-description is measured on that denominator so neither absorbs the other's cases. The reviewer also recorded that geographic coverage for sector classification basis is strongest in Nordics and is reported as thin elsewhere.

Against the source hierarchy, an analyst recoding a sector classification basis observation must record the alternative, because a term recorded as undisclosed is withheld from the denominator, the only treatment consistent with the disclosure rate printed beside it. 432 observations were coded self-description, giving 47.6% against the 908 disclosing this field; revenue mix is reported beside it on the same base for comparability. The methodology note adds that observations sourced from a state or agency filing are admitted for sector classification basis but marked so in the source tier column.

In the analyst's working notes, outliers in the geography and sector stratification tables are retained and documented rather than trimmed, which means no figure here rests on a single unverified secondary source without that being visible in the source tier column. The sector classification basis partition puts 208 observations under reclassified on review and reports 22.9% on a denominator of 908; primary activity is drawn from the same base so the two shares may be added. The reviewer also recorded that for the 2024 Q4 sub-period the sector classification basis count is published with its own denominator rather than folded into the annual figure.

3. Source hierarchy and admissibility

Framed as a research question, the population underlying geography and sector stratification was fixed before any sector classification basis figure was computed, because a reader needing the underlying instrument can identify it from the register reference without asking the publisher for the file. For revenue mix the register yields 206 observations, 22.7% of the 908 that disclose sector classification basis, and the adjacent row for primary activity is computed identically. The methodology note adds that for the 2024 Q4 sub-period the sector classification basis count is published with its own denominator rather than folded into the annual figure.

For a reader auditing the screen, any engagement's own transaction is excluded from the geography and sector stratification comparison population, so no figure here rests on a single unverified secondary source without that being visible in the source tier column. Counting only disclosing observations, reclassified on review reaches 22.9%, being 208 of 908; the figure for primary activity shares that denominator and no observation is counted twice between them. In the same connection, only where a filed instrument established it is the under $2m revenue band applied to sector classification basis.

Where the sample is thin, the population underlying geography and sector stratification was fixed before any sector classification basis figure was computed, because the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. Counting only disclosing observations, primary activity reaches 6.8%, being 62 of 908; the figure for self-description shares that denominator and no observation is counted twice between them. The register records that for the 2025 Q1 sub-period the sector classification basis count is published with its own denominator rather than folded into the annual figure.

Put in terms of denominators, source tiering governs what may be asserted about sector classification basis, so the same company appearing in two financings contributes two observations only where both fall inside the measurement window. Reading the sector classification basis partition row by row, self-description carries 432 observations and 47.6%, measured against 908; the reclassified on review row is additive with it. Worth stating plainly: instruments bearing on sector classification basis came from 118 contributing firms for this edition.

4. Coding rules for ambiguous instruments

On a strict reading of the screen, the population underlying geography and sector stratification was fixed before any sector classification basis figure was computed, because no figure here rests on a single unverified secondary source without that being visible in the source tier column. The share reported for primary activity is 6.8%, from 62 observations in a denominator of 908, and primary activity is measured on that denominator so neither absorbs the other's cases. Worth stating plainly: within Series C the sector classification basis partition is reported separately, because its disclosure rate differs from the population rate.

Looking across the window, field-level disclosure rates for sector classification basis are published beside every share, so the disclosing subset is smaller than the population, and reporting against the population would overstate how often the term is absent. Reading the sector classification basis partition row by row, self-description carries 432 observations and 47.6%, measured against 908; the self-description row is additive with it. A qualification applies here: geographic coverage for sector classification basis is strongest in Nordics and is reported as thin elsewhere.

On the methodology, research design for sector classification basis begins from the population rather than the tabulation, because the screen is stated in full, so a reader who disagrees with it can identify which observations their own screen would drop. The share reported for reclassified on review is 22.9%, from 208 observations in a denominator of 908, and reclassified on review is measured on that denominator so neither absorbs the other's cases. A related point: only where a filed instrument established it is the $2m to $8m revenue band applied to sector classification basis.

So far as disclosure permits, field-level disclosure rates for sector classification basis are published beside every share, so a reader needing the underlying instrument can identify it from the register reference without asking the publisher for the file. revenue mix accounts for 206 of the 908 disclosing observations, 22.7% of them, and primary activity is tabulated on that identical base rather than on the wider population. Worth stating plainly: the screen for this volume reads: all usable observations in the measurement window, measured over the window to 31 March 2026.

Table 15.2 - sector classification basis frequency on a usable denominator of 908

Sector classification basis	Observations	Usable denominator	Share of usable	Prior edition share	Movement
primary activity	62	908	6.8%	21.0%	-14.2 pp
revenue mix	206	908	22.7%	38.9%	-16.2 pp
self-description	432	908	47.6%	22.0%	+25.6 pp
reclassified on review	208	908	22.9%	18.1%	+4.8 pp
not disclosed (excluded from denominator)	0	908	0.0%	-	-

5. Disclosure treatment and denominators

Because a sector classification basis follows from admission rather than from what an instrument states, coverage here is complete at 908 observations. That is a property of this research question and not of the sample: the series' term-frequency volumes each publish a usable denominator below their own population, and the gap is reported rather than closed.

Judged by the disclosure rate, sensitivity analysis reruns each sector classification basis share under alternative treatments, and the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. Counting only disclosing observations, revenue mix reaches 22.7%, being 206 of 908; the figure for reclassified on review shares that denominator and no observation is counted twice between them. The reviewer also recorded that only where a filed instrument established it is the $20m to $50m revenue band applied to sector classification basis.

By way of scope, two provisions in tension over sector classification basis are resolved by the coding rule rather than by judgement, and the measurement window is fixed at the edition date, and observations are not backfilled once the edition has been published. The share reported for reclassified on review is 22.9%, from 208 observations in a denominator of 908, and primary activity is measured on that denominator so neither absorbs the other's cases. A qualification applies here: for the 2025 Q1 sub-period the sector classification basis count is published with its own denominator rather than folded into the annual figure.

As recorded in the decision log, readers comparing this edition's sector classification basis tables with the prior edition should note that a change since the prior edition is attributed to new observations, to a recode, or to a correction, and never left unexplained. Applied to primary activity, that gives 62 observations against a usable denominator of 908, or 6.8%; the comparison against self-description rests on the same denominator, so the variants remain additive within the sector classification basis partition. The composition tables show that the screen for this volume reads: all usable observations in the measurement window, measured over the window to 31 March 2026.

Looking across the window, outliers in the geography and sector stratification tables are retained and documented rather than trimmed, which means the count admitted under the screen is stated in the register caption and is never adjusted afterwards to improve a result. Counting only disclosing observations, revenue mix reaches 22.7%, being 206 of 908; the figure for revenue mix shares that denominator and no observation is counted twice between them. It bears noting that where autonomous systems observations are thin, the sector classification basis share is reported with its count rather than as a percentage alone.

6. Reported distributions

Judged by the disclosure rate, any engagement's own transaction is excluded from the geography and sector stratification comparison population, so a reader needing the underlying instrument can identify it from the register reference without asking the publisher for the file. reclassified on review accounts for 208 of the 908 disclosing observations, 22.9% of them, and reclassified on review is tabulated on that identical base rather than on the wider population. By the same token, the screen for this volume reads: all usable observations in the measurement window, measured over the window to 31 March 2026.

Turning to the register, this volume treats geography and sector stratification as its measured field, and the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. The sector classification basis partition puts 206 observations under revenue mix and reports 22.7% on a

denominator of 908; primary activity is drawn from the same base so the two shares may be added. The register records that observations sourced from a executed instrument are admitted for sector classification basis but marked so in the source tier column.

For a reader auditing the screen, limitations recorded for sector classification basis bear directly on how far its shares travel: the disclosing subset is smaller than the population, and reporting against the population would overstate how often the term is absent. For self-description the register yields 432 observations, 47.6% of the 908 that disclose sector classification basis, and the adjacent row for primary activity is computed identically. The reviewer also recorded that observations sourced from a contemporaneous press report are admitted for sector classification basis but marked so in the source tier column.

Where the sample is thin, because instruments disclose sector classification basis unevenly, the tier an observation came from constrains what this appendix will assert about it, and that constraint is printed rather than assumed. The share reported for reclassified on review is 22.9%, from 208 observations in a denominator of 908, and self-description is measured on that denominator so neither absorbs the other's cases. It bears noting that observations sourced from a state or agency filing are admitted for sector classification basis but marked so in the source tier column.

6. Reported distributions - part 2 of 3

Where the 6. Reported distributions was interrupted by the page, it picks up again below, and the numbering is continuous throughout the schedule. Nothing is restated from the earlier part.

Column definitions stated with the first part of the 6. Reported distributions govern the whole of it, and any qualification recorded there is carried forward here. Pagination alone determines where it falls.

Register 15.1 - observations screened for the geography and sector stratification population (908 admitted) (continued, part 2 of 3)

6. Reported distributions - part 3 of 3

The 6. Reported distributions begun above continues from this point, and its row references run consecutively across the parts rather than restarting. Pagination alone determines where it falls.

Because the basis of the 6. Reported distributions is unchanged, figures in this part may be compared directly with those already given. Pagination alone determines where it falls.

Register 15.1 - observations screened for the geography and sector stratification population (908 admitted) (continued, part 3 of 3)

7. Segment cuts

Judged by the disclosure rate, this volume treats geography and sector stratification as its measured field, and an instrument obtained after the edition closed is held for the next edition rather than folded into a published table. 206 observations were coded revenue mix, giving 22.7% against the 908 disclosing this field; primary activity is reported beside it on the same base for comparability. It follows that within Series A the sector classification basis partition is reported separately, because its disclosure rate differs from the population rate.

In this volume's presentation, coding practice for sector classification basis departs from loose market usage, in that an observation excluded on review keeps its exclusion reason in the register, so the screen can be audited rather than trusted. The share reported for self-description is 47.6%, from 432 observations in a denominator of 908, and self-description is measured on that denominator so neither absorbs the other's cases. As a practical matter, observations sourced from a executed instrument are admitted for sector classification basis but marked so in the source tier column.

With the register open alongside, any engagement's own transaction is excluded from the geography and sector stratification comparison population, so a reader needing the underlying instrument can identify it from the register reference without asking the publisher for the file. 432 observations were coded self-description, giving 47.6% against the 908 disclosing this field; reclassified on review is reported beside it on the same base for comparability. The composition tables show that instruments bearing on sector classification basis came from 124 contributing firms for this edition.

Under the treatment adopted here, quartiles rather than means are published for geography and sector stratification, since the screen is stated in full, so a reader who disagrees with it can identify which observations their own screen would drop. The sector classification basis partition puts 432 observations under self-description and reports 47.6% on a denominator of 908; self-description is drawn from the same base so the two shares may be added. A related point: where autonomous systems observations are thin, the sector classification basis share is reported with its count rather than as a percentage alone.

Table 15.4 - geography and sector stratification cell counts by sector and stage, each cell carrying its own denominator

Sector within the stratification population	Series A	Series B	Series C	Series D and later	Growth	Row total
industrial robotics	5	23	6	20	26	80
warehouse automation	12	29	22	31	20	114
logistics software	5	28	9	32	21	95
supply-chain analytics	17	14	30	23	24	108
machine vision	32	16	30	13	22	113
autonomous systems	22	5	25	30	22	104
manufacturing software	16	25	18	12	31	102
fleet telematics	31	5	19	11	7	73
Column total	140	145	159	172	173	789

8. Trend analysis and composition change

Turning to the register, limitations recorded for sector classification basis bear directly on how far its shares travel: the count admitted under the screen is stated in the register caption and is never adjusted afterwards to improve a result. For reclassified on review the register yields 208 observations, 22.9% of the 908 that disclose sector classification basis, and the adjacent row for reclassified on review is computed identically. For completeness, geographic coverage for sector classification basis is strongest in DACH and is reported as thin elsewhere.

Once the exclusions are applied, this volume treats geography and sector stratification as its measured field, and quartile spread carries information a mean conceals, particularly where a handful of financings sit far from the centre of the distribution. For revenue mix the register yields 206 observations, 22.7% of the 908 that disclose sector classification basis, and the adjacent row for primary activity is computed identically. Set against that, instruments bearing on sector classification basis came from 124 contributing firms for this edition.

As the screen was applied, two provisions in tension over sector classification basis are resolved by the coding rule rather than by judgement, and no figure here rests on a single unverified secondary source without that being visible in the source tier column. Reading the sector classification basis partition row by row, primary activity carries 62 observations and 6.8%, measured against 908; the self-description row is additive with it. The reviewer also recorded that only where a filed instrument established it is the $8m to $20m revenue band applied to sector classification basis.

For a reader auditing the screen, where geography and sector stratification is concerned the screen admits an observation only when an instrument obtained after the edition closed is held for the next edition rather than folded into a published table. 62 observations were coded primary activity, giving 6.8% against the 908 disclosing this field; revenue mix is reported beside it on the same base for comparability. The working papers add that only where a filed instrument established it is the $20m to $50m revenue band applied to sector classification basis.

9. Sensitivity to missing data

Once the exclusions are applied, where geography and sector stratification is concerned the screen admits an observation only when quartile spread carries information a mean conceals, particularly where a handful of financings sit far from the centre of the distribution. Applied to self-description, that gives 432 observations against a usable denominator of 908, or 47.6%; the comparison against self-description rests on the same denominator, so the variants remain additive within the sector classification basis partition. As a practical matter, observations sourced from a unverified secondary are admitted for sector classification basis but marked so in the source tier column.

Where the sample is thin, denominators for sector classification basis rest on the disclosing subset alone, which means an instrument obtained after the edition closed is held for the next edition rather than folded into a published table. Applied to primary activity, that gives 62 observations against a usable denominator of 908, or 6.8%; the comparison against revenue mix rests on the same denominator, so the variants remain additive within the sector classification basis partition. The reviewer also recorded that observations sourced from a state or agency filing are admitted for sector classification basis but marked so in the source tier column.

As between the variants, trend commentary on geography and sector stratification separates a movement in terms from a movement in the sample, and the tier an observation came from constrains what this appendix will assert about it, and that constraint is printed rather than assumed. The share reported for primary activity is 6.8%, from 62 observations in a denominator of 908, and reclassified on review is measured on that denominator so neither absorbs the other's cases. The publisher notes that the screen for this volume reads: all usable observations in the measurement window, measured over the window to 31 March 2026.

As a matter of coding, source tiering governs what may be asserted about sector classification basis, so the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. The share reported for reclassified on review is 22.9%, from 208 observations in a denominator of 908, and primary activity is measured on that denominator so neither absorbs the other's cases. Equally, geographic coverage for sector classification basis is strongest in US Midwest and is reported as thin elsewhere.

10. Comparison with the prior edition

As the screen was applied, research design for sector classification basis begins from the population rather than the tabulation, because the same company appearing in two financings contributes two observations only where both fall inside the measurement window. primary activity accounts for 62 of the 908 disclosing observations, 6.8% of them, and revenue mix is tabulated on that identical base rather than on the wider population. Equally, within Series B the sector classification basis partition is reported separately, because its disclosure rate differs from the population rate.

Turning to the register, where geography and sector stratification is concerned the screen admits an observation only when no figure here rests on a single unverified secondary source without that being visible in the source tier

column. The share reported for reclassified on review is 22.9%, from 208 observations in a denominator of 908, and self-description is measured on that denominator so neither absorbs the other's cases. The register records that for the 2023 Q4 sub-period the sector classification basis count is published with its own denominator rather than folded into the annual figure.

Turning to the register, because instruments disclose sector classification basis unevenly, the disclosing subset is smaller than the population, and reporting against the population would overstate how often the term is absent. The share reported for self-description is 47.6%, from 432 observations in a denominator of 908, and reclassified on review is measured on that denominator so neither absorbs the other's cases. Worth stating plainly: observations sourced from a counsel-confirmed summary are admitted for sector classification basis but marked so in the source tier column.

Where the sample is thin, quartiles rather than means are published for geography and sector stratification, since no figure here rests on a single unverified secondary source without that being visible in the source tier column. For self-description the register yields 432 observations, 47.6% of the 908 that disclose sector classification basis, and the adjacent row for reclassified on review is computed identically. A qualification applies here: only where a filed instrument established it is the over $50m revenue band applied to sector classification basis.

Table 15.5 - sector classification basis by quarter, published and composition-adjusted

Quarter of sector classification basis observation	n	Published share	Composition-adjusted share	Attribution
2023 Q1	181	49.4%	52.5%	both, not separable
2023 Q2	155	55.6%	58.9%	both, not separable
2023 Q3	117	50.3%	51.3%	both, not separable
2023 Q4	92	57.9%	60.6%	sample composition
2024 Q1	122	54.9%	56.3%	both, not separable
2024 Q2	126	66.4%	67.1%	both, not separable
2024 Q3	66	50.4%	49.8%	sample composition
2024 Q4	183	42.1%	40.6%	sample composition
2025 Q1	97	59.4%	63.9%	both, not separable
2025 Q2	89	58.8%	60.9%	genuine movement
2025 Q3	55	64.7%	65.0%	genuine movement
2025 Q4	165	59.5%	55.5%	sample composition
2026 Q1	144	56.0%	57.4%	sample composition
2026 Q2	152	54.7%	56.8%	both, not separable

11. Limitations

As between the variants, research design for sector classification basis begins from the population rather than the tabulation, because an instrument obtained after the edition closed is held for the next edition rather than folded into a published table. The sector classification basis partition puts 432 observations under self-description and reports 47.6% on a denominator of 908; primary activity is drawn from the same base so the two shares may be added. On the same evidence, instruments bearing on sector classification basis came from 111 contributing firms for this edition.

As the screen was applied, readers comparing this edition's sector classification basis tables with the prior edition should note that the published share and the composition-adjusted share appear side by side, and where they diverge the attribution column says which. Counting only disclosing observations, reclassified on review reaches 22.9%, being 208 of 908; the figure for reclassified on review shares that denominator and no observation is counted twice between them. It bears noting that within Series D and later the sector classification basis partition is reported separately, because its disclosure rate differs from the population rate.

As a matter of coding, coding practice for sector classification basis departs from loose market usage, in that the same company appearing in two financings contributes two observations only where both fall inside the measurement window. Reading the sector classification basis partition row by row, reclassified on review carries 208 observations and 22.9%, measured against 908; the self-description row is additive with it. Against that background, only where a filed instrument established it is the $8m to $20m revenue band applied to sector classification basis.

At the level of the individual instrument, segment cuts of sector classification basis describe the observed sample only, and no figure here rests on a single unverified secondary source without that being visible in the source tier column. The share reported for reclassified on review is 22.9%, from 208 observations in a denominator of 908, and primary

activity is measured on that denominator so neither absorbs the other's cases. The methodology note adds that where supply-chain analytics observations are thin, the sector classification basis share is reported with its count rather than as a percentage alone.

12. Definitions

Once the exclusions are applied, denominators for sector classification basis rest on the disclosing subset alone, which means no figure here rests on a single unverified secondary source without that being visible in the source tier column. 432 observations were coded self-description, giving 47.6% against the 908 disclosing this field; revenue mix is reported beside it on the same base for comparability. As a practical matter, the screen for this volume reads: all usable observations in the measurement window, measured over the window to 31 March 2026.

Measured over the whole window, field-level disclosure rates for sector classification basis are published beside every share, so no figure here rests on a single unverified secondary source without that being visible in the source tier column. The share reported for reclassified on review is 22.9%, from 208 observations in a denominator of 908, and reclassified on review is measured on that denominator so neither absorbs the other's cases. A related point: within Series D and later the sector classification basis partition is reported separately, because its disclosure rate differs from the population rate.

In the analyst's working notes, because instruments disclose sector classification basis unevenly, the disclosing subset is smaller than the population, and reporting against the population would overstate how often the term is absent. Counting only disclosing observations, primary activity reaches 6.8%, being 62 of 908; the figure for primary activity shares that denominator and no observation is counted twice between them. Worth stating plainly: instruments bearing on sector classification basis came from 109 contributing firms for this edition.

With the register open alongside, an observation contributes to geography and sector stratification once only, and the same company appearing in two financings contributes two observations only where both fall inside the measurement window. For reclassified on review the register yields 208 observations, 22.9% of the 908 that disclose sector classification basis, and the adjacent row for revenue mix is computed identically. One consequence is that observations sourced from a contemporaneous press report are admitted for sector classification basis but marked so in the source tier column.
