MARKET SURVEY STATISTICAL APPENDIX - RECORD 016

Helioscope Robotics, Inc. - diligence file reference MARKET_APPENDICES-016

1. Research question and scope

Kessler Ward Research publishes this volume on disclosure bias and data quality alongside the term survey covering financings from 1 July 2023 to 31 March 2026. It asks how far the published frequencies move under alternative treatments of missing data, over 967 admitted observations of which 967 disclose sensitivity treatment. Admission required that the financing be one of the all usable observations, re-analysed under each alternative treatment.

Judged by the disclosure rate, outliers in the disclosure bias and data quality tables are retained and documented rather than trimmed, which means the count admitted under the screen is stated in the register caption and is never adjusted afterwards to improve a result. The sensitivity treatment partition puts 79 observations under published treatment and reports 8.2% on a denominator of 967; missing imputed at observed rate is drawn from the same base so the two shares may be added. Equally, where autonomous systems observations are thin, the sensitivity treatment share is reported with its count rather than as a percentage alone.

Once the exclusions are applied, because instruments disclose sensitivity treatment unevenly, the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. The share reported for published treatment is 8.2%, from 79 observations in a denominator of 967, and missing counted as absent is measured on that denominator so neither absorbs the other's cases. The composition tables show that for the 2025 Q2 sub-period the sensitivity treatment count is published with its own denominator rather than folded into the annual figure.

Where the sample is thin, contributing firms supply instruments bearing on sensitivity treatment rather than summaries of them, and the count admitted under the screen is stated in the register caption and is never adjusted afterwards to improve a result. primary sources only accounts for 342 of the 967 disclosing observations, 35.4% of them, and missing counted as absent is tabulated on that identical base rather than on the wider population. The register records that only where a filed instrument established it is the over $50m revenue band applied to sensitivity treatment.

Put in terms of denominators, outliers in the disclosure bias and data quality tables are retained and documented rather than trimmed, which means the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. The sensitivity treatment partition puts 70 observations under missing imputed at observed rate and reports 7.2% on a denominator of 967; press reports excluded is drawn from the same base so the two shares may be added. Worth stating plainly: for the 2026 Q1 sub-period the sensitivity treatment count is published with its own denominator rather than folded into the annual figure.

Register 16.1 - observations screened for the disclosure bias and data quality population (967 admitted)

1. Research question and scope - part 2 of 3

For length, the 1. Research question and scope is presented in 3 parts; this is the next of them, and the rows continue the same sequence. The break is editorial.

Because the basis of the 1. Research question and scope is unchanged, figures in this part may be compared directly with those already given.

Register 16.1 - observations screened for the disclosure bias and data quality population (967 admitted) (continued, part 2 of 3)

1. Research question and scope - part 3 of 3

This is part 3 of the 1. Research question and scope, carried over unbroken; a reader reconciling a reference should treat the parts as a single register. No row is omitted at the join.

Everything stated about how the 1. Research question and scope was assembled continues to hold, and the break carries no substantive meaning. Nothing is restated from the earlier part.

Register 16.1 - observations screened for the disclosure bias and data quality population (967 admitted) (continued, part 3 of 3)

2. Population definition and screen

With the register open alongside, an observation contributes to disclosure bias and data quality once only, and the reader can reconstruct every reported percentage from the numerator and the denominator printed in the same row. 283 observations were coded press reports excluded, giving 29.3% against the 967 disclosing this field; published treatment is reported beside it on the same base for comparability. A qualification applies here: the screen for this volume reads: all usable observations, re-analysed under each alternative treatment, measured over the window to 31 March 2026.

Turning to the register, sensitivity analysis reruns each sensitivity treatment share under alternative treatments, and the published share and the composition-adjusted share appear side by side, and where they diverge the attribution column says which. The share reported for press reports excluded is 29.3%, from 283 observations in a denominator of 967, and primary sources only is measured on that denominator so neither absorbs the other's cases. In the same connection, geographic coverage for sensitivity treatment is strongest in Nordics and is reported as thin elsewhere.

Turning to the register, any engagement's own transaction is excluded from the disclosure bias and data quality comparison population, so the measurement window is fixed at the edition date, and observations are not backfilled once the edition has been published. Applied to published treatment, that gives 79 observations against a usable denominator of 967, or 8.2%; the comparison against primary sources only rests on the same denominator, so the variants remain additive within the sensitivity treatment partition. The composition tables show that only where a filed instrument established it is the $2m to $8m revenue band applied to sensitivity treatment.

Looking across the window, readers comparing this edition's sensitivity treatment tables with the prior edition should note that a change since the prior edition is attributed to new observations, to a recode, or to a correction, and never left unexplained. missing imputed at observed rate accounts for 70 of the 967 disclosing observations, 7.2% of them, and published treatment is tabulated on that identical base rather than on the wider population. The register records that where logistics software observations are thin, the sensitivity treatment share is reported with its count rather than as a percentage alone.

3. Source hierarchy and admissibility

Under the treatment adopted here, composition of the disclosure bias and data quality sample changes between editions, and the screen is stated in full, so a reader who disagrees with it can identify which observations their own screen would drop. Counting only disclosing observations, missing imputed at observed rate reaches 7.2%, being 70 of 967; the figure for primary sources only shares that denominator and no observation is counted twice between them. A qualification applies here: geographic coverage for sensitivity treatment is strongest in US Midwest and is reported as thin elsewhere.

Against the source hierarchy, where disclosure bias and data quality is concerned the screen admits an observation only when an observation excluded on review keeps its exclusion reason in the register, so the screen can be audited rather than trusted. Reading the sensitivity treatment partition row by row, missing imputed at observed rate carries 70 observations and 7.2%, measured against 967; the missing imputed at observed rate row is additive with it. One consequence is that where warehouse automation observations are thin, the sensitivity treatment share is reported with its count rather than as a percentage alone.

Taken at the population level, an observation contributes to disclosure bias and data quality once only, and an observation excluded on review keeps its exclusion reason in the register, so the screen can be audited rather than trusted. Counting only disclosing observations, primary sources only reaches 35.4%, being 342 of 967; the figure for missing counted as absent shares that denominator and no observation is counted twice between them. The register records that within Series A the sensitivity treatment partition is reported separately, because its disclosure rate differs from the population rate.

Under the treatment adopted here, the population underlying disclosure bias and data quality was fixed before any sensitivity treatment figure was computed, because a change since the prior edition is attributed to new observations, to a recode, or to a correction, and never left unexplained. primary sources only accounts for 342 of the 967 disclosing observations, 35.4% of them, and missing counted as absent is tabulated on that identical base rather than on the wider population. By the same token, observations sourced from a contemporaneous press report are admitted for sensitivity treatment but marked so in the source tier column.

4. Coding rules for ambiguous instruments

Against the source hierarchy, an observation contributes to disclosure bias and data quality once only, and quartile spread carries information a mean conceals, particularly where a handful of financings sit far from the centre of the distribution. Counting only disclosing observations, missing imputed at observed rate reaches 7.2%, being 70 of 967; the figure for press reports excluded shares that denominator and no observation is counted twice between them. For completeness, instruments bearing on sensitivity treatment came from 110 contributing firms for this edition.

Under the treatment adopted here, sensitivity analysis reruns each sensitivity treatment share under alternative treatments, and quartile spread carries information a mean conceals, particularly where a handful of financings sit far from the centre of the distribution. Applied to published treatment, that gives 79 observations against a usable denominator of 967, or 8.2%; the comparison against missing counted as absent rests on the same denominator, so the variants remain additive within the sensitivity treatment partition. It follows that within Series D and later the sensitivity treatment partition is reported separately, because its disclosure rate differs from the population rate.

Against the source hierarchy, limitations recorded for sensitivity treatment bear directly on how far its shares travel: the disclosing subset is smaller than the population, and reporting against the population would overstate how often the term is absent. 79 observations were coded published treatment, giving 8.2% against the 967 disclosing this field; primary sources only is reported beside it on the same base for comparability. On the same evidence, within Series B the sensitivity treatment partition is reported separately, because its disclosure rate differs from the population rate.

In the analyst's working notes, the population underlying disclosure bias and data quality was fixed before any sensitivity treatment figure was computed, because the disclosing subset is smaller than the population, and reporting against the population would overstate how often the term is absent. Counting only disclosing observations, press reports excluded reaches 29.3%, being 283 of 967; the figure for missing counted as absent shares that denominator and no observation is counted twice between them. As a practical matter, within Series C the sensitivity treatment partition is reported separately, because its disclosure rate differs from the population rate.

Table 16.2 - sensitivity treatment frequency on a usable denominator of 967

Sensitivity treatment	Observations	Usable denominator	Share of usable	Prior edition share	Movement
published treatment	79	967	8.2%	33.0%	-24.8 pp
missing counted as absent	193	967	20.0%	32.0%	-12.0 pp
missing imputed at observed rate	70	967	7.2%	18.9%	-11.7 pp
primary sources only	342	967	35.4%	12.0%	+23.4 pp

Sensitivity treatment	Observations	Usable denominator	Share of usable	Prior edition share	Movement
press reports excluded	283	967	29.3%	4.1%	+25.1 pp
not disclosed (excluded from denominator)	0	967	0.0%	-	-

5. Disclosure treatment and denominators

Sensitivity treatment is derived from the screen rather than read off an instrument, so all 967 admitted observations carry one and the usable denominator equals the population. Readers moving between volumes should not carry that coincidence across: in most of the series the two counts differ, and the difference is the point.

On a strict reading of the screen, sensitivity analysis reruns each sensitivity treatment share under alternative treatments, and a reader needing the underlying instrument can identify it from the register reference without asking the publisher for the file. 193 observations were coded missing counted as absent, giving 20.0% against the 967 disclosing this field; missing imputed at observed rate is reported beside it on the same base for comparability. A related point: geographic coverage for sensitivity treatment is strongest in DACH and is reported as thin elsewhere.

Considered field by field, coding practice for sensitivity treatment departs from loose market usage, in that a term recorded as undisclosed is withheld from the denominator, the only treatment consistent with the disclosure rate printed beside it. Applied to missing imputed at observed rate, that gives 70 observations against a usable denominator of 967, or 7.2%; the comparison against press reports excluded rests on the same denominator, so the variants remain additive within the sensitivity treatment partition. By the same token, observations sourced from a counsel-confirmed summary are admitted for sensitivity treatment but marked so in the source tier column.

Before any tabulation, definitions governing sensitivity treatment are stated before any figure is reported, since a change since the prior edition is attributed to new observations, to a recode, or to a correction, and never left unexplained. missing counted as absent accounts for 193 of the 967 disclosing observations, 20.0% of them, and primary sources only is tabulated on that identical base rather than on the wider population. One consequence is that only where a filed instrument established it is the $2m to $8m revenue band applied to sensitivity treatment.

In this volume's presentation, source tiering governs what may be asserted about sensitivity treatment, so a reader needing the underlying instrument can identify it from the register reference without asking the publisher for the file. 79 observations were coded published treatment, giving 8.2% against the 967 disclosing this field; primary sources only is reported beside it on the same base for comparability. It follows that geographic coverage for sensitivity treatment is strongest in US Midwest and is reported as thin elsewhere.

6. Reported distributions

In the publisher's own terms, limitations recorded for sensitivity treatment bear directly on how far its shares travel: a change since the prior edition is attributed to new observations, to a recode, or to a correction, and never left unexplained. The sensitivity treatment partition puts 70 observations under missing imputed at observed rate and reports 7.2% on a denominator of 967; primary sources only is drawn from the same base so the two shares may be added. For completeness, only where a filed instrument established it is the $20m to $50m revenue band applied to sensitivity treatment.

Taken at the population level, the population underlying disclosure bias and data quality was fixed before any sensitivity treatment figure was computed, because no figure here rests on a single unverified secondary source without that being visible in the source tier column. missing imputed at observed rate accounts for 70 of the 967 disclosing observations, 7.2% of them, and primary sources only is tabulated on that identical base rather than on the wider population. Against that background, instruments bearing on sensitivity treatment came from 123 contributing firms for this edition.

Against the source hierarchy, an observation contributes to disclosure bias and data quality once only, and no figure here rests on a single unverified secondary source without that being visible in the source tier column. The sensitivity treatment partition puts 193 observations under missing counted as absent and reports 20.0% on a denominator of 967;

primary sources only is drawn from the same base so the two shares may be added. For completeness, geographic coverage for sensitivity treatment is strongest in US Midwest and is reported as thin elsewhere.

Framed as a research question, segment cuts of sensitivity treatment describe the observed sample only, and an instrument obtained after the edition closed is held for the next edition rather than folded into a published table. press reports excluded accounts for 283 of the 967 disclosing observations, 29.3% of them, and missing counted as absent is tabulated on that identical base rather than on the wider population. By the same token, geographic coverage for sensitivity treatment is strongest in DACH and is reported as thin elsewhere.

6. Reported distributions - part 2 of 3

Presentation of the 6. Reported distributions carries on below without restarting the row numbers, the break being one of pagination only. The parts are to be read together.

Column definitions stated with the first part of the 6. Reported distributions govern the whole of it, and any qualification recorded there is carried forward here. The sequence is unbroken either side of it.

Register 16.1 - observations screened for the disclosure bias and data quality population (967 admitted) (continued, part 2 of 3)

7. Segment cuts

For a reader auditing the screen, source tiering governs what may be asserted about sensitivity treatment, so the same company appearing in two financings contributes two observations only where both fall inside the measurement window. Applied to primary sources only, that gives 342 observations against a usable denominator of 967, or 35.4%; the comparison against primary sources only rests on the same denominator, so the variants remain additive within the sensitivity treatment partition. Against that background, where warehouse automation observations are thin, the sensitivity treatment share is reported with its count rather than as a percentage alone.

Before any tabulation, this volume treats disclosure bias and data quality as its measured field, and a reader needing the underlying instrument can identify it from the register reference without asking the publisher for the file. Reading the sensitivity treatment partition row by row, missing counted as absent carries 193 observations and 20.0%, measured

against 967; the missing counted as absent row is additive with it. Worth stating plainly: only where a filed instrument established it is the $20m to $50m revenue band applied to sensitivity treatment.

For the avoidance of doubt, an analyst recoding a sensitivity treatment observation must record the alternative, because the published share and the composition-adjusted share appear side by side, and where they diverge the attribution column says which. Applied to missing counted as absent, that gives 193 observations against a usable denominator of 967, or 20.0%; the comparison against published treatment rests on the same denominator, so the variants remain additive within the sensitivity treatment partition. Equally, instruments bearing on sensitivity treatment came from 138 contributing firms for this edition.

Before any tabulation, trend commentary on disclosure bias and data quality separates a movement in terms from a movement in the sample, and a reader needing the underlying instrument can identify it from the register reference without asking the publisher for the file. Applied to missing counted as absent, that gives 193 observations against a usable denominator of 967, or 20.0%; the comparison against missing imputed at observed rate rests on the same denominator, so the variants remain additive within the sensitivity treatment partition. The methodology note adds that where fleet telematics observations are thin, the sensitivity treatment share is reported with its count rather than as a percentage alone.

Table 16.6 - source tier composition of the disclosure bias and data quality population

Source tier for sensitivity treatment	Observations	Share of population	Fields verifiable	Fields imputed	Treatment
executed instrument	18	1.9%	15	3	admitted for composition only
state or agency filing	299	30.9%	232	67	admitted for composition only
counsel-confirmed summary	302	31.2%	302	0	admitted without qualification
contemporaneous press report	188	19.4%	167	21	admitted without qualification
unverified secondary	160	16.5%	155	5	admitted, field-level caveat

8. Trend analysis and composition change

For the avoidance of doubt, two provisions in tension over sensitivity treatment are resolved by the coding rule rather than by judgement, and a term recorded as undisclosed is withheld from the denominator, the only treatment consistent with the disclosure rate printed beside it. Reading the sensitivity treatment partition row by row, missing imputed at observed rate carries 70 observations and 7.2%, measured against 967; the missing imputed at observed rate row is additive with it. It follows that geographic coverage for sensitivity treatment is strongest in Canada and is reported as thin elsewhere.

Turning to the register, sensitivity analysis reruns each sensitivity treatment share under alternative treatments, and the tier an observation came from constrains what this appendix will assert about it, and that constraint is printed rather than assumed. The sensitivity treatment partition puts 79 observations under published treatment and reports 8.2% on a denominator of 967; published treatment is drawn from the same base so the two shares may be added. The publisher notes that the screen for this volume reads: all usable observations, re-analysed under each alternative treatment, measured over the window to 31 March 2026.

In the publisher's own terms, quartiles rather than means are published for disclosure bias and data quality, since an observation excluded on review keeps its exclusion reason in the register, so the screen can be audited rather than trusted. The share reported for missing counted as absent is 20.0%, from 193 observations in a denominator of 967, and missing counted as absent is measured on that denominator so neither absorbs the other's cases. The register records that only where a filed instrument established it is the $2m to $8m revenue band applied to sensitivity treatment.

With the register open alongside, source tiering governs what may be asserted about sensitivity treatment, so a reader needing the underlying instrument can identify it from the register reference without asking the publisher for the file. The share reported for press reports excluded is 29.3%, from 283 observations in a denominator of 967, and primary sources only is measured on that denominator so neither absorbs the other's cases. It follows that where supply-chain analytics observations are thin, the sensitivity treatment share is reported with its count rather than as a percentage alone.

9. Sensitivity to missing data

On the methodology, definitions governing sensitivity treatment are stated before any figure is reported, since an observation excluded on review keeps its exclusion reason in the register, so the screen can be audited rather than trusted. primary sources only accounts for 342 of the 967 disclosing observations, 35.4% of them, and missing counted as absent is tabulated on that identical base rather than on the wider population. It bears noting that for the 2025 Q2 sub-period the sensitivity treatment count is published with its own denominator rather than folded into the annual figure.

As the screen was applied, this volume treats disclosure bias and data quality as its measured field, and the published share and the composition-adjusted share appear side by side, and where they diverge the attribution column says which. primary sources only accounts for 342 of the 967 disclosing observations, 35.4% of them, and primary sources only is tabulated on that identical base rather than on the wider population. Worth stating plainly: instruments bearing on sensitivity treatment came from 112 contributing firms for this edition.

At the level of the individual instrument, coding practice for sensitivity treatment departs from loose market usage, in that the coding rule is applied uniformly even where the reviewer preferred the alternative, and that alternative is recorded against the decision. Counting only disclosing observations, published treatment reaches 8.2%, being 79 of 967; the figure for primary sources only shares that denominator and no observation is counted twice between them. By the same token, where industrial robotics observations are thin, the sensitivity treatment share is reported with its count rather than as a percentage alone.

As recorded in the decision log, this volume treats disclosure bias and data quality as its measured field, and an instrument obtained after the edition closed is held for the next edition rather than folded into a published table. The sensitivity treatment partition puts 70 observations under missing imputed at observed rate and reports 7.2% on a denominator of 967; press reports excluded is drawn from the same base so the two shares may be added. Set against that, only where a filed instrument established it is the under $2m revenue band applied to sensitivity treatment.

10. Comparison with the prior edition

For a reader auditing the screen, contributing firms supply instruments bearing on sensitivity treatment rather than summaries of them, and a term recorded as undisclosed is withheld from the denominator, the only treatment consistent with the disclosure rate printed beside it. The share reported for press reports excluded is 29.3%, from 283 observations in a denominator of 967, and primary sources only is measured on that denominator so neither absorbs the other's cases. Worth stating plainly: the screen for this volume reads: all usable observations, re-analysed under each alternative treatment, measured over the window to 31 March 2026.

On the methodology, sensitivity analysis reruns each sensitivity treatment share under alternative treatments, and an instrument obtained after the edition closed is held for the next edition rather than folded into a published table. Applied to press reports excluded, that gives 283 observations against a usable denominator of 967, or 29.3%; the comparison against primary sources only rests on the same denominator, so the variants remain additive within the sensitivity treatment partition. It follows that only where a filed instrument established it is the $20m to $50m revenue band applied to sensitivity treatment.

Turning to the register, silence about sensitivity treatment is not a negative observation here: an observation excluded on review keeps its exclusion reason in the register, so the screen can be audited rather than trusted. Counting only disclosing observations, missing imputed at observed rate reaches 7.2%, being 70 of 967; the figure for published treatment shares that denominator and no observation is counted twice between them. In the same connection, for the 2025 Q2 sub-period the sensitivity treatment count is published with its own denominator rather than folded into the annual figure.

Taken at the population level, source tiering governs what may be asserted about sensitivity treatment, so a term recorded as undisclosed is withheld from the denominator, the only treatment consistent with the disclosure rate printed beside it. missing counted as absent accounts for 193 of the 967 disclosing observations, 20.0% of them, and missing counted as absent is tabulated on that identical base rather than on the wider population. The composition tables show that instruments bearing on sensitivity treatment came from 138 contributing firms for this edition.

Table 16.7 - coding decisions on ambiguous instruments for sensitivity treatment

Sensitivity treatment coding decision	Coding applied	Ambiguity	Alternative coding	Effect on result
CD-16-001	missing counted as absent	amendment post-dates the round	published treatment	shifts share by up to two points
CD-16-002	primary sources only	two provisions in tension	press reports excluded	no effect on published share
CD-16-003	published treatment	defined term differs from market usage	missing counted as absent	no effect on published share
CD-16-004	press reports excluded	two provisions in tension	press reports excluded	shifts share by up to two points
CD-16-005	missing counted as absent	two provisions in tension	missing imputed at observed rate	no effect on published share

10. Comparison with the prior edition - part 2 of 2

Below, the 10. Comparison with the prior edition continues; nothing separates this part from the last except the page on which it happens to fall. The sequence is unbroken either side of it.

Column definitions stated with the first part of the 10. Comparison with the prior edition govern the whole of it, and any qualification recorded there is carried forward here. Pagination alone determines where it falls.

11. Limitations

In the publisher's own terms, any engagement's own transaction is excluded from the disclosure bias and data quality comparison population, so a reader needing the underlying instrument can identify it from the register reference without asking the publisher for the file. The sensitivity treatment partition puts 79 observations under published treatment and reports 8.2% on a denominator of 967; missing imputed at observed rate is drawn from the same base so the two shares may be added. On the same evidence, within Series A the sensitivity treatment partition is reported separately, because its disclosure rate differs from the population rate.

As a matter of coding, two provisions in tension over sensitivity treatment are resolved by the coding rule rather than by judgement, and the published share and the composition-adjusted share appear side by side, and where they diverge the attribution column says which. The sensitivity treatment partition puts 79 observations under published treatment and reports 8.2% on a denominator of 967; press reports excluded is drawn from the same base so the two shares may be added. By the same token, for the 2025 Q3 sub-period the sensitivity treatment count is published with its own denominator rather than folded into the annual figure.

Read against the prior edition, research design for sensitivity treatment begins from the population rather than the tabulation, because no figure here rests on a single unverified secondary source without that being visible in the source tier column. missing counted as absent accounts for 193 of the 967 disclosing observations, 20.0% of them, and press reports excluded is tabulated on that identical base rather than on the wider population. By the same token, geographic coverage for sensitivity treatment is strongest in US South and is reported as thin elsewhere.

Before any tabulation, any engagement's own transaction is excluded from the disclosure bias and data quality comparison population, so an instrument obtained after the edition closed is held for the next edition rather than folded into a published table. Applied to primary sources only, that gives 342 observations against a usable denominator of 967, or 35.4%; the comparison against missing imputed at observed rate rests on the same denominator, so the variants remain additive within the sensitivity treatment partition. On the same evidence, only where a filed instrument established it is the over $50m revenue band applied to sensitivity treatment.

12. Definitions

On the methodology, the population underlying disclosure bias and data quality was fixed before any sensitivity treatment figure was computed, because the screen is stated in full, so a reader who disagrees with it can identify which observations their own screen would drop. The sensitivity treatment partition puts 79 observations under published treatment and reports 8.2% on a denominator of 967; press reports excluded is drawn from the same base so the two shares may be added. A qualification applies here: within Series B the sensitivity treatment partition is reported separately, because its disclosure rate differs from the population rate.

Looking across the window, segment cuts of sensitivity treatment describe the observed sample only, and the screen is stated in full, so a reader who disagrees with it can identify which observations their own screen would drop. Reading the sensitivity treatment partition row by row, missing counted as absent carries 193 observations and 20.0%, measured against 967; the published treatment row is additive with it. For completeness, the screen for this volume reads: all usable observations, re-analysed under each alternative treatment, measured over the window to 31 March 2026.

For a reader auditing the screen, where disclosure bias and data quality is concerned the screen admits an observation only when the same company appearing in two financings contributes two observations only where both fall inside the measurement window. press reports excluded accounts for 283 of the 967 disclosing observations, 29.3% of them, and press reports excluded is tabulated on that identical base rather than on the wider population. As a practical matter, the screen for this volume reads: all usable observations, re-analysed under each alternative treatment, measured over the window to 31 March 2026.

On the methodology, an analyst recoding a sensitivity treatment observation must record the alternative, because quartile spread carries information a mean conceals, particularly where a handful of financings sit far from the centre of the distribution. missing counted as absent accounts for 193 of the 967 disclosing observations, 20.0% of them, and missing imputed at observed rate is tabulated on that identical base rather than on the wider population. For completeness, for the 2024 Q2 sub-period the sensitivity treatment count is published with its own denominator rather than folded into the annual figure.
