Comparable Issuer Factsheet
Wabash National — relative-value factsheet, prepared as of 2026-06-30
Sector: Trailer and Trailer Equipment Manufacturing
Wabash National designs and builds van trailers and related trailer equipment at its Indiana manufacturing campus, selling to freight carriers and dealers whose equipment purchasing runs on a capacity-and-freight-rate cycle rather than on multi-year service contracts, so order volumes swing materially with the freight market.

Instrument summary

Field	Value
Issuer	Wabash National
CUSIP	C0100XAA2
Bond symbol	COMPA4A
Coupon	4.5%
Maturity	2028-10-15
Next call date and price	2027-10-15 at 101.125
Current rating	B+
Current price (2026-06-30)	95.315
Yield to worst (approximate convenience figure)	6.697%
Spread (spread to interpolated Treasury (G-spread convention))	255bp
Reported trade-size / liquidity label (2026-06-30 print)	1MM+

Spread basis
The basis printed above, spread to interpolated Treasury (G-spread convention), is simply what this issuer's own FINRA TRACE extract carries; a reader stacking Wabash National's spread against a different comp's, or against the target's own senior notes, has to check that basis first, since a spread-to-Treasury number and a spread-to-swap number are two different quantities even when the basis-point count matches. As an anchor check rather than a second quote: Wabash National's 255bp level sits -44bp against the B-band index OAS of 2.99% observed on 2026-06-30, the desk's issue-specific adjustment for this name's standing inside the band, not an index-published figure.

Benchmark curve context
Wabash National sits roughly 2.30 years from the 2026-06-30 valuation date. The published Treasury curve that day skips the 4-Year tenor entirely and is not monotonic at either end - the 6-Month point prints above the 1-Year point, and the 20-Year point prints above the 30-Year point - so reading any benchmark off it, including for a remaining term that falls between the published 3-Year and 5-Year points, requires an actual linear interpolation between the two bracketing points, not a shortcut to whichever published tenor happens to be closest.

Tenor	Par yield (2026-06-30)
1 Mo	3.70%
1.5 Month	3.74%
2 Mo	3.77%
3 Mo	3.87%
4 Mo	3.92%
6 Mo	4.01%
1 Yr	3.98%
2 Yr	4.14%
3 Yr	4.15%
5 Yr	4.19%
7 Yr	4.30%
10 Yr	4.44%
20 Yr	4.93%
30 Yr	4.91%

Wabash National's remaining term of 2.30 years falls between the published tenors bracketing it, so the interpolated benchmark is 4.14% + ((2.30 - 2) / (3 - 2)) x (4.15% - 4.14%) = 4.1430%, not a naive read of either bracketing tenor alone.
Against that 4.1430% interpolated benchmark, Wabash National's own 6.697% yield to worst implies a spread consistent with the 255bp figure stated on the spread to interpolated Treasury (G-spread convention) basis above; a reader who instead read the nearest published tenor without interpolating would compute a materially different, and incorrect, benchmark level.

Comparison to the target's own senior notes
Purely for context: the target's own senior unsecured notes carry a 7.75% coupon due 2031-06-15, rated B1/B+, and last printed at 98.250 on 2026-06-30 per the target's separate TRACE extract - which states its own spread on a basis that extract, not this factsheet, discloses. Before treating any gap between Wabash National and the target as a genuine relative-value signal, confirm both figures share a common basis, exactly as the note on spread basis above requires within this comparable universe.

Liquidity

Over the week of 2026-06-26 through 2026-06-30, Wabash National's TRACE prints ranged from an odd-lot size up to prints at or beyond the non-investment-grade dissemination cap, which is why they are disseminated at that cap's own label rather than at their actual traded size - the reason the 2026-06-30 print above shows the 1MM+ label.

Key financial metrics (indicative)

Metric (indicative desk estimate)	FY2024	FY2025	LTM
Revenue growth	3.5%	4.1%	4.3%
EBITDA margin	18.1%	18.6%	18.9%
Debt/EBITDA	3.0x	3.0x	2.8x
EBITDA/Interest	4.4x	4.5x	4.7x

The table above is a desk estimate built for relative-value screening, not a figure drawn from Wabash National's own audited financial statements - which this desk does not hold - and it should not be cited as Wabash National's own reported result. Its only purpose is to give a rough sense of this name's scale and leverage against the other four names in the comparable universe further below.

Credit profile

Its credit profile is characterized by high fixed-asset intensity and pronounced sensitivity to the freight cycle: trailer orders decelerate sharply when freight rates soften and carriers defer equipment replacement, and recover with capacity tightness. The desk's indicative metrics below should be read with that cyclicality in mind, carrying a wider uncertainty band than a less cyclical manufacturer's would.

This desk's reading of the issuer's own public filings is that capital deployment has prioritized balance-sheet deleveraging through the freight-cycle soft patch; a reader should confirm that reading against the issuer's current disclosures rather than treat it as a restatement of management guidance.

Structural features

The notes are senior unsecured obligations, ranking pari passu with the issuer's other unsecured indebtedness and structurally subordinated to any secured revolving credit facility the issuer maintains for working-capital purposes. None of the structural features just described changes the spread basis stated earlier: Wabash National's spread is carried on the spread to interpolated Treasury (G-spread convention) basis exactly as its own TRACE extract prints it, regardless of where these features rank within Wabash National's own capital structure.

Risks to the relative-value view

» A freight-rate downturn that leads carriers to defer fleet replacement, leaving the company's trailer backlog to burn down faster than new orders replace it.

» Steel and component input costs rising faster than the company's pricing surcharges and backlog repricing can pass them through.

» A sharper-than-expected contraction in carrier credit availability, which would compound the equipment-demand cycle with customer-financing stress.

Historical trading range (indicative, 2026 year to date)

Period	Approximate price range	Approximate yield range
January 2026	92.315 - 92.815	7.297 - 7.427
February-March 2026	92.815 - 93.565	7.207 - 7.297
April-May 2026	93.565 - 94.815	6.827 - 7.207
June 2026 (through 2026-06-30)	94.815 - 95.315	6.697 - 6.827

Wabash National's price has stayed within a fairly narrow band year to date, consistent with a stable rating and outlook rather than an actively deteriorating or improving credit; the ranges above are indicative desk observations, not a formal TRACE time series, and should not stand in for the actual TRACE extract for any period before the 2026-06-26 through 2026-06-30 window it covers.

Comparable universe overview

Issuer	Coupon	Maturity	Rating	Spread basis
Wabash National (this factsheet)	4.5%	2028-10-15	B+	Treasury
Sensata Technologies	5.875%	2030-09-01	BB+	Treasury
Atkore	4.25%	2031-06-01	BB+	Swap
O-I Glass	7.375%	2032-06-01	BB	Swap
Dauch Corp	7.75%	2033-10-15	B+	Treasury

Wabash National is Comparable Issuer A in the five-name universe above, which spans a range of coupons, maturities, ratings and spread bases; this factsheet develops only its own entry in depth, and each other issuer's own factsheet carries the corresponding detail for that name.

Sector overview

The trailer manufacturing sector runs on the freight capacity cycle: equipment orders decelerate when freight rates soften and carriers defer replacement, and accelerate when capacity tightens. Over the trailing year the sector has worked through a backlog normalization after the prior expansion, and we would view the pace at which an individual trailer manufacturer's own orders stabilize against that backdrop, rather than any single quarter's shipment print, as the better indicator of its relative-value positioning.

Outlook commentary

Looking ahead, we would view a sustained reduction in leverage toward the lower end of the range shown in the Key financial metrics table above as supportive of a tighter spread over time, while a resumption of debt-funded acquisition activity would likely widen it, independent of any formal rating agency action on this name.

This outlook commentary reflects this desk's own view, prepared for internal relative-value screening; it is not a credit rating and does not speak for Wabash National's own management beyond the specific commentary attributed to that management under Credit profile above.

Documentation

Wabash National's notes were issued under a New York law-governed indenture, the customary choice of law for a US high-yield issuance; this factsheet does not reproduce that indenture's defined terms in full, so a reader needing the exact covenant or redemption language should go to Wabash National's own indenture rather than rely on this summary characterization.

The call feature shown for Wabash National in the Instrument summary table reflects the redemption disclosure in the issuer's own filed annual report - the notes are redeemable at a premium during the final twelve months before their maturity - while the full optional-redemption schedule, including any make-whole terms ahead of that window, lives in the issuer's own indenture and is not restated here.

Rating rationale cross-reference

The B+ rating shown above is this desk's attribution of Wabash National's senior unsecured rating tier as of the research date, assembled from agency rating knowledge rather than taken from a live agency feed; a reader relying on the notch should confirm the agency's current published rating directly, since attributions of this kind can lag a published action.

For completeness: Wabash National is not a party to the credit agreement, indenture, or municipal conduit financing discussed in this project's own rating agency reports on Kestrel Industries; Wabash National is an independent, unrelated comparable used solely for relative-value screening, with no ownership, guarantee, or contractual link between the two.

Additional trading color

Beyond the four tabulated TRACE prints, desk color on Wabash National over the trailing quarter has been consistent with an orderly two-way market rather than one-sided pressure; no block trade materially larger than the sizes in the Historical trading range table above has been observed, and this liquidity assessment should be read together with that table, not as an independent conclusion.

A reader who sees materially different Wabash National pricing from a source other than the TRACE extract cited here should treat the TRACE print as authoritative for actual executed trades, and should confirm which basis - bid, offer, or last-trade - the other source is quoting before concluding the two disagree.

Covenant package summary (indicative)

Covenant	Type	Comment
Limitation on Indebtedness	Incurrence-based total net leverage ratio test	Indicative for a B+ rated callable issuer of this scale: total net leverage may not exceed 4.50x, stepping to 5.00x following a permitted acquisition, the standard high-yield incurrence formulation this desk's summary reflects.
Limitation on Restricted Payments	Builder basket plus ratio prong	Restricted payments are permitted from a growing builder basket, or while total net leverage is below 3.50x, the builder-basket-plus-ratio structure customary for a callable B+ credit in this desk's summary.
Limitation on Liens	General lien basket plus permitted encumbrances	A capped general lien basket sized off a fixed dollar amount plus a percentage of tangible net worth - the usual middle ground for a callable high-yield issuer.
Change of Control	Repurchase offer upon a qualifying event	A callable issue of this kind pairs its own call schedule with a change-of-control repurchase offer; whether that offer carries a ratings-decline qualifier varies by issuer and is not restated in this indicative table.
Reporting covenant	Periodic reporting to trustee and holders	Standard high-yield reporting covenant with no maintenance test, consistent with this issuer's incurrence-based B+ package.

The covenant summary above is this desk's characterization of the package structure Wabash National's own filed debt disclosures describe, stated at the summary level a desk factsheet carries rather than quoted from the indenture; exact covenant language, basket sizes, or exceptions applicable to Wabash National are governed by the indenture itself, not this table.

Frequently asked questions

Why spread to interpolated Treasury (G-spread convention) rather than the other basis used elsewhere in this universe? Because that is what Wabash National's own TRACE extract carries; this desk reports each name's spread on whatever basis that name's own extract uses, rather than converting everyone onto one basis, so every figure here ties directly back to a verifiable source.

Is the yield to worst shown Wabash National's own officially reported figure? No - it is an approximate convenience

figure this desk computed from the reported price, coupon, and remaining term, the same way FINRA's own YLD_PT field is a derived convenience figure rather than the contractually primary quantity, which is price.
Does Wabash National have any relationship to the target company whose bond complex this corpus otherwise concerns? No; see Rating rationale cross-reference above.

Recovery considerations

Wabash National's notes rank as a senior unsecured obligation - behind any secured indebtedness the issuer carries in a hypothetical default and pari passu with its other unsecured debt. This desk does not publish its own recovery estimate for this name; a formal Recovery Rating, where one exists, should be sourced from the relevant rating agency's own published issue-level action for this issuer.
In a going-concern default scenario for an issuer of this size and sector, a senior unsecured issue of this kind would generally be expected to recover across a wide range depending on how much secured debt ranks ahead of it at default; this factsheet does not attempt to narrow that range, since doing so would require balance-sheet detail this desk does not hold for this comparable.

Capital structure and ranking detail (indicative)

Beyond the senior unsecured notes themselves, the trailer manufacturer's capital structure includes an asset-based revolving credit facility secured by receivables and inventory, a structure common among equipment manufacturers whose working-capital needs move with the trailer build cycle rather than with a steady, low-seasonality demand curve. Utilization under that facility has historically peaked ahead of the industry's seasonal fleet-replacement deliveries, consistent with the customer mix described above.
This desk does not model an intercompany or subsidiary-guarantee structure for this issuer beyond what is stated under Structural features above; where an ABL facility sits ahead of unsecured noteholders on a first-lien basis over receivables and inventory, as is typical for this sector, unsecured recovery in a stress scenario would be correspondingly more sensitive to the amount drawn under that facility at the time of default than to enterprise value alone.
A reader modeling this issuer's own leverage capacity should also bear in mind that a trailer manufacturer's capital expenditure program tends to be lumpier than its working-capital swings, since new assembly capacity or model-specific fixturing is typically added in discrete increments tied to an anticipated order cycle rather than smoothed evenly across fiscal years; this desk has not modeled a specific future capacity addition for this issuer.

Extended relative-value screen against the peer set

Screened against the other four names in this comparable universe, this issuer's freight-cycle revenue places it closest in cyclical character to the driveline name - both are manufactured-goods credits whose volumes follow someone else's equipment decisions - but through carrier capital-spending rather than OEM platform schedules, and it is the least comparable of the five to the construction-driven conduit name on end-market timing.
A reader using this comparable universe to triangulate a fair-value spread for the target's own senior notes should weight this issuer's relative-value signal according to where the freight cycle sits when the comparison is made, rather than assuming all five names carry equal weight in that exercise; this factsheet does not itself perform that weighting.
Among the sector labels represented in this comparable universe, Trailer and Trailer Equipment Manufacturing is, in this desk's own categorization, the one whose demand arrives through a third party's own capital-spending decision - the carrier's fleet-replacement choice - rather than through consumer, construction or production-schedule demand, a distinction a reader should keep in mind when attributing spread differences across the five names to a common cause.

Additional desk observations (sector-specific)

This desk's own screen of publicly available freight-cost and fleet-age indicators suggests carrier equipment-replacement deferral, rather than steel input costs alone, has been the more consequential demand variable for trailer manufacturers of this issuer's scale over the trailing four quarters; where a manufacturer's backlog repricing provisions lag the spot market, that lag would not automatically capture a sudden demand downturn, a nuance worth flagging when reading the Credit profile section above.
Trailer manufacturers of this issuer's approximate scale have generally financed capacity additions from internally generated cash flow rather than incremental debt over the trailing two years, consistent with the deleveraging trend noted under Credit profile above; this desk has not identified a public announcement of a debt-funded capacity expansion for this specific issuer as of the 2026-06-30 valuation date.
This desk would also flag, purely as a screening consideration rather than an issuer-specific finding, that trailer demand has historically shown higher cyclicality than the broader industrial-products universe, since equipment replacement can be deferred when freight rates soften in a way food consumption or electrical code compliance cannot; this desk has not adjusted this issuer's indicative metrics above for that higher-cyclicality characterization, which would, if anything, argue for treating the leverage figures shown as an aggressive rather than a conservative read.
Finally, this desk notes that a trailer manufacturer's order backlog, being quoted in delivery slots rather than binding revenue, can be rescheduled by customers in a downturn, which this desk would expect to amplify reported revenue volatility for an issuer of this kind relative to a backlog-backed peer, a further reason this desk regards the leverage figures shown above as requiring a cyclicality haircut rather than face-value reading.

Desk contacts

Jeffrey Alvarado — Relative Value, Leveraged Finance Trading Desk

Questions about this factsheet, or requests for an updated print, go to the desk contacts above, not to the rating agencies named elsewhere in this corpus, which had no role in preparing this internal desk work product.

Revision history

Date	Change
2026-04-09	Initial factsheet prepared
2026-05-11	Optional-call schedule re-run after this callable issuer's April coupon date passed; no change to the redemption feature shown above
2026-06-30	Pricing refreshed to this factsheet's own valuation date (current version)

Only the 2026-06-30 pricing in the Instrument summary table above is current; the two earlier revisions are kept only for this factsheet's own internal audit trail and should not be used to price Wabash National's notes as of the 2026-06-30 valuation date this corpus otherwise uses.

Distribution restrictions

This factsheet is prepared solely for this desk's own internal relative-value analysts and the internal credit committee process referenced elsewhere in this corpus; it is not distributed externally, is not a research report under any applicable broker-dealer research-independence rule, and is not an offer or solicitation to buy or sell any security, and should not be relied on by anyone outside the desk that prepared it.

Wabash National and the other four names in this comparable universe are used here purely as relative-value reference points and are not covered issuers of this desk's own published external research, to the extent any exists; where external research does cover any of these five names, treat it as the more authoritative source on any topic this factsheet also touches.

This factsheet's own version is identified by the Revision history table above; a reader citing a figure from it in a separate memorandum should cite the 2026-06-30 revision specifically, since an earlier revision's pricing is, by that same table's own terms, superseded and should not be relied upon.

Nothing here should be read as a statement about Kestrel Industries's own bond complex, the credit agreement, the senior notes indenture, or the municipal conduit financing discussed elsewhere in this corpus; Wabash National is an independent comparable, and this factsheet's sole purpose is relative-value screening against that separate bond complex, not a restatement of its terms.

Model inputs and assumptions

Input	Value used	Source
Day-count convention (yield approximation)	Actual/365	This desk's own convention
Benchmark curve	2026-06-30 published Treasury par yield curve	Treasury/FRED, retrieved 2026-08-17
Swap curve (I-spread comps only)	Committee-supplied swap curve	Internal, not independently published
Dissemination cap applied	Non-investment-grade ($1,000,000)	FINRA TRACE rulebook
Pricing date	2026-06-30	FINRA TRACE extract for this issuer

The inputs above are used identically across all five factsheets in this comparable universe - none of the other four uses a different day-count convention, benchmark curve, or dissemination-cap assumption - so comparing spreads across the universe compares like with like on every input except the spread basis itself, which the spread-basis note above addresses.

Frequently referenced terms

G-spread: the spread of a bond's yield over the yield of an interpolated point on the on-the-run Treasury par yield curve at the bond's own remaining maturity, expressed in basis points.

I-spread: the spread of a bond's yield over the yield of an interpolated point on the swap curve at the bond's own remaining maturity, expressed in basis points - a different benchmark from the G-spread above, and not interchangeable with it even when both are printed to the same number of basis points.

Yield to worst: the lower of a bond's yield to maturity and its yield to each scheduled call date, computed on the assumption the issuer calls (or does not call) the bond in whichever way produces the lower yield to the holder; the approximate convenience figure on this factsheet's Instrument summary table is not a precise yield-to-worst calculation and should not be treated as one.

Dissemination cap: the maximum trade size FINRA's TRACE system publicly discloses for a given security class; a print at or above the cap is shown at the cap's own label rather than at its true size, which is why two prints of very different true size can carry an identical disseminated label.

Note on sourcing

This factsheet is an internal desk work product, not a standardized public filing; no regulator publishes, and no single public template governs, a comparable-bond relative-value factsheet of this kind. Its content is assembled from the same TRACE print, published Treasury curve, and issuer-rating information cited above, and it does not purport to reproduce any specific real desk's own internal template.
