Comparable Issuer Factsheet
Atkore — relative-value factsheet, prepared as of 2026-06-30
Sector: Electrical Conduit and Cable Management
Atkore manufactures steel and PVC electrical conduit, fittings and cable management products at plants concentrated in the Midwest, selling through electrical distributors into construction projects whose timing follows non-residential construction starts rather than vehicle production or freight rates.

Instrument summary

Field	Value
Issuer	Atkore
CUSIP	C0300XAA4
Bond symbol	COMPC4A
Coupon	4.25%
Maturity	2031-06-01
Next call date and price	2028-06-01 at 100.000
Current rating	BB+
Current price (2026-06-30)	92.357
Yield to worst (approximate convenience figure)	6.033%
Spread (spread to interpolated swap curve (I-spread convention))	195bp
Reported trade-size / liquidity label (2026-06-30 print)	1MM+

Spread basis
Atkore's spread to interpolated swap curve (I-spread convention) spread above is a direct pass-through of the TRACE print, not a desk conversion. Before comparing it to another name's spread, or to the target's own senior notes, confirm the other figure is stated on the same basis - a Treasury-basis number and a swap-basis number can carry the same basis-point count and still not mean the same thing. Its level is anchored, not free-floating: the BB-band index OAS observed 2026-06-30 was 1.64%, against which Atkore's 195bp print stands at +31bp of desk-attributed adjustment.

Benchmark curve context
The 2026-06-30 Treasury par curve has two quirks worth flagging before benchmarking Atkore, whose remaining term is about 4.92 years: it has no published 4-Year point, and it is not monotonic near either end of the curve (6-Month over 1-Year; 20-Year over 30-Year). Any tenor falling between two published points - Atkore's own remaining term among them - has to be linearly interpolated rather than mapped to whichever published point is nearest.

Tenor	Par yield (2026-06-30)
1 Mo	3.70%
1.5 Month	3.74%
2 Mo	3.77%
3 Mo	3.87%
4 Mo	3.92%
6 Mo	4.01%
1 Yr	3.98%
2 Yr	4.14%
3 Yr	4.15%
5 Yr	4.19%
7 Yr	4.30%
10 Yr	4.44%
20 Yr	4.93%
30 Yr	4.91%

Atkore's 4.92-year remaining term falls inside the gap between two published tenors, so this factsheet interpolates linearly to 4.1885%, computed as 4.15% + ((4.92 - 3) / (5 - 3)) x (4.19% - 4.15%); neither bracketing tenor read alone would be correct.
The 195bp figure stated on the spread to interpolated swap curve (I-spread convention) basis above follows from setting Atkore's 6.033% yield to worst against the 4.1885% interpolated benchmark; a nearest-tenor shortcut in place of that interpolation would give a materially different, incorrect, benchmark.

Comparison to the target's own senior notes
The target's own senior notes - 7.75% coupon, 2031-06-15 maturity, B1/B+ rated, last printed at 98.250 on 2026-06-30 - are noted here for context only; its spread basis is disclosed in its own separate extract, not restated on this page. Any comparison between Atkore and the target requires confirming both spreads share a basis before the difference between them means anything.

Liquidity
The five trading days ending 2026-06-30 produced a range of Atkore print sizes - some odd-lot, some at or above the non-investment-grade dissemination cap. Prints at the cap disseminate under that cap's own label rather than their true size, and that is why the 2026-06-30 print above carries the 1MM+ label.

Key financial metrics (indicative)

Metric (indicative desk estimate)	FY2024	FY2025	LTM
Revenue growth	3.5%	4.1%	4.3%
EBITDA margin	18.2%	18.8%	19.0%
Debt/EBITDA	2.9x	2.8x	2.6x
EBITDA/Interest	4.6x	4.7x	4.9x

This desk assembled the metrics above for internal screening purposes only; they are not sourced from Atkore's own audited financials, which this desk does not have access to, and should not be quoted as Atkore's reported figures. Their function is limited to giving a rough read on scale and leverage relative to the other four names in the comparable universe shown later.

Credit profile

Its credit profile benefits from steady replacement-and-construction demand for electrical infrastructure products and a price/volume model that has historically passed steel input-cost swings through to distributors with a lag, offset by sensitivity to non-residential construction starts, which we view as the single macro variable this name's volumes track most closely.

This desk's reading of the issuer's own public filings is that capacity and product-line investment is funded from operating cash flow with no near-term appetite for debt-funded expansion; a reader should confirm that reading against the issuer's current disclosures rather than treat it as a restatement of management guidance.

Structural features

The notes are senior unsecured obligations of the operating company itself, rather than of a separate holding company, which avoids the structural subordination a holding-company note structure would otherwise introduce relative to operating-level liabilities.

Whatever these structural features imply about capital-structure ranking, they leave the spread basis untouched: Atkore's spread is stated on the spread to interpolated swap curve (I-spread convention) basis exactly as its TRACE extract carries it, independent of the features described above.

Risks to the relative-value view

» A slowdown in non-residential construction starts, which this desk views as the demand variable this issuer's volumes track most closely.

» Steel price volatility moving faster than the pass-through lag embedded in distributor pricing, compressing margin between price revisions.

» Distributor destocking beyond normal seasonal patterns, amplifying a demand soft patch at the factory level.

Historical trading range (indicative, 2026 year to date)

Period	Approximate price range	Approximate yield range
January 2026	89.357 - 89.857	6.633 - 6.763
February-March 2026	89.857 - 90.607	6.543 - 6.633
April-May 2026	90.607 - 91.857	6.163 - 6.543
June 2026 (through 2026-06-30)	91.857 - 92.357	6.033 - 6.163

The narrow trading band Atkore has shown so far this year fits a stable rating and outlook rather than a credit in active transition; note that the figures above are indicative desk observations, not a formal TRACE time series, and do not substitute for the actual TRACE extract for periods before the 2026-06-26 through 2026-06-30 window.

Comparable universe overview

Issuer	Coupon	Maturity	Rating	Spread basis
Wabash National	4.5%	2028-10-15	B+	Treasury
Sensata Technologies	5.875%	2030-09-01	BB+	Treasury
Atkore (this factsheet)	4.25%	2031-06-01	BB+	Swap
O-I Glass	7.375%	2032-06-01	BB	Swap
Dauch Corp	7.75%	2033-10-15	B+	Treasury

Atkore appears as Comparable Issuer C in the universe above, which ranges across several coupons, maturities, ratings and spread bases; only Atkore's own entry is developed in depth here, with the remaining four names each covered at that same depth in their own respective factsheets.

Sector overview

The electrical conduit and cable management sector tracks non-residential construction activity closely, with a structural demand layer from vehicle-charging, data-center and grid-modernization buildout that does not move one-for-one with traditional commercial construction. Steel input costs remain the sector's principal margin variable, and issuers differ mainly in how quickly their distributor pricing passes those swings through.

Outlook commentary

Looking ahead, we would view the non-residential construction outlook, together with the lag at which steel input-cost moves reach this issuer's distributor pricing, as the key variables to watch for this name's spread over the next twelve months.

This is this desk's internal view, written for relative-value screening rather than as a credit rating; it should not be read as Atkore's own management's guidance except where that guidance is specifically attributed to management under

Credit profile above.

Documentation

As is customary for US high-yield issuance, Atkore's indenture is governed by New York law; this factsheet summarizes rather than reproduces that indenture's defined terms, so precise covenant or redemption language should be sourced from Atkore's own indenture directly.

A conventional three-year-before-maturity par-call assumption, not Atkore's actual optional-redemption terms, produces the call date and price shown in the Instrument summary table; the real schedule, with any step-down premium periods, is in Atkore's own indenture.

Rating rationale cross-reference

Atkore's BB+ attribution above reflects this desk's senior-unsecured rating knowledge as of the research date, not a citation to a specific published action; scorecard factors, outlook and triggers belong to the agency's own publication, which a reader should consult before relying on the notch.

Atkore has no relationship to the credit agreement, indenture, or municipal conduit financing discussed in this project's rating agency reports on Kestrel Industries - it is an unrelated comparable included solely for relative-value screening, with no ownership, guarantee, or contractual tie to either.

Additional trading color

Apart from the four tabulated TRACE prints, Atkore desk color over the trailing quarter has shown an orderly two-way market, not one-sided flow; this desk has not seen a block trade materially larger than the sizes in the Historical trading range table above, and this color should be paired with that table rather than read alone.

If a different source shows materially different pricing for Atkore than the TRACE extract cited here, the TRACE print should be treated as authoritative for actual executed trades; confirm the other source's basis - bid, offer, or last-trade - before concluding the two figures conflict.

Covenant package summary (indicative)

Covenant	Type	Comment
Limitation on Indebtedness	Incurrence ratio with a capped incremental basket	A mid-package formulation for a BB+ attributed callable issuer: the incurrence test sits at 3.50x total net leverage, with a capped incremental facility on top sized at a fixed dollar amount rather than an open-ended grower.
Limitation on Restricted Payments	Builder basket with a modest grower	Restricted payments run through a builder basket with a modest annual grower, or while pro forma total net leverage is below 3.00x - a formulation one step looser than a ratio-only package but well short of covenant-lite.
Limitation on Liens	Capped dollar lien basket	A capped dollar lien basket without a ratio prong, consistent with a package that carries some basket flexibility but no grower mechanics.
Change of Control	Repurchase offer, no ratings-decline qualifier	The notes are callable, and the change-of-control repurchase offer applies on a qualifying event without a ratings-decline qualifier in this desk's summary.
Reporting covenant	Periodic reporting to trustee and holders	Standard incurrence-based reporting covenant, with basket-cap compliance confirmed in the annual officer certificate.

This desk has summarized Atkore's covenant package at the level a desk factsheet carries, keyed to the issuer's rating attribution and its filed debt disclosures; the summary is not a restatement of the indenture, and exact language, basket sizes, and exceptions should be read from Atkore's own indenture.

Frequently asked questions

Atkore's spread is stated on a spread to interpolated swap curve (I-spread convention) basis here because that is the basis Atkore's own TRACE extract carries; rather than converting the whole universe onto a single convention, this desk keeps each name on its own extract's basis so every number traces back to a verifiable source.

The yield to worst figure is not officially reported by Atkore - this desk computed it as a convenience approximation from price, coupon, and remaining term, in the same spirit as FINRA's own YLD_PT field, which is likewise a derived convenience number rather than the contractually primary quantity of price.

No relationship exists between Atkore and the target company this corpus otherwise addresses; the Rating rationale cross-reference section above covers this point.

Recovery considerations

Atkore's notes carry senior unsecured status: subordinate to any secured indebtedness at default, on equal footing with the issuer's other unsecured debt. This desk does not independently estimate recovery for this name, so a reader wanting a formal Recovery Rating should consult that agency's own published issue-level rating action for Atkore, where one has been published, rather than infer a recovery figure from this factsheet's own relative-value screening content.

A wide recovery range would generally be expected for a senior unsecured issue of this kind from an issuer of this size and sector in a going-concern default, with the amount of secured debt ranking ahead of it at default the main driver; this desk lacks the balance-sheet detail for this comparable that would be needed to narrow the range, so none is offered.

Capital structure and ranking detail (indicative)

The conduit manufacturer's capital structure pairs the senior unsecured notes with working capital that is dominated by steel purchases and distributor receivables; a revolver sized against those two lines, rather than against inventory of finished goods alone, is the customary structure for a producer of this type.

Steel-price swings move the working-capital line before they move the margin line, since purchases reprice immediately while distributor pricing adjusts on a lag; a reader modeling this issuer's seasonal liquidity should treat that timing gap as the principal driver of interim revolver utilization.

Capital expenditure concentrates in extrusion, coating and finishing capacity, which is added in discrete line increments tied to expected construction demand rather than continuously; this desk has not modeled a specific line addition for this issuer.

Extended relative-value screen against the peer set

Relative to the other four names in this universe, this issuer's construction-starts exposure makes it the least directly comparable, on an end-market basis, to the target's own industrial bond complex; its principal relative-value utility in this universe lies in benchmarking spread-to-rating relationships generally, not in end-market comparability to the target.

This desk includes this issuer in the comparable universe primarily for spread-to-rating benchmarking purposes rather than end-market comparability to the target; a reader who wants an end-market-comparable read on the target's own bond complex should weight the other four names in this universe more heavily than this one.

Of the five sector labels represented in this universe, Electrical Conduit and Cable Management is, in this desk's own categorization, the one most directly tied to a single macro variable (non-residential construction activity), a distinction relevant to attributing this issuer's own spread moves correctly between sector-wide and issuer-specific causes.

Additional desk observations (sector-specific)

Non-residential construction permit activity has, in this desk's informal tracking, generally led electrical-product demand by one to two quarters, a pattern that would tend to signal demand softening or improvement before it reaches the factory even absent any issuer-specific operating shortfall.

This desk is not aware of a pending announcement of a major plant addition or closure directly affecting this issuer's production footprint as of the 2026-06-30 valuation date, though capacity decisions are revisited periodically across the sector and would be a relevant development to monitor going forward.

This desk would also note, as a general sector observation rather than an issuer-specific finding, that electrical infrastructure demand tied to vehicle-charging, data-center and grid modernization buildout has historically shown more resilience through a commercial-construction downturn than traditional office or retail construction demand, since those projects are driven by different capital budgets.

This desk would also note that a conduit producer's mix between steel and PVC product lines carries different input-cost sensitivities, so a mix shift between the two, even at flat overall revenue, changes the issuer's effective input-cost exposure; this desk has not identified a specific mix disclosure of that kind for this issuer.

Steel-price volatility for a producer of this kind has, in this desk's informal tracking, generally passed through to distributor pricing with a one-to-two-quarter lag, and the margin cost of that lag is larger in a fast-rising steel market than a slow one; this desk has not modeled a specific pass-through lag for this issuer.

Distributor inventory behavior amplifies factory-level demand swings in this sector: destocking that follows a demand soft patch typically deepens the factory's volume decline beyond the underlying construction demand change, and this desk has not confirmed whether this issuer's distributor base has followed that pattern in the most recent cycle.

The reader should also bear in mind that the indicative metrics table above does not disaggregate the issuer's price-versus-volume contributions in any of the three periods it presents, nor its exposure to any single distributor relationship, and this desk regards that omission as immaterial to the relative-value conclusions drawn elsewhere in this factsheet; a reader requiring that breakdown should request it directly from the issuer rather than infer it from this table.

Desk contacts

Tracey Benton — Relative Value, Leveraged Finance Trading Desk

Joshua Adams — Relative Value, Leveraged Finance Trading Desk

Route any question about this factsheet, or a request for a refreshed print, to the desk contacts shown above; the rating agencies named elsewhere in this corpus had no involvement in preparing this internal work product.

Revision history

Date	Change
2026-04-17	Initial factsheet prepared
2026-05-27	Rating-attribution line added: the desk's BB+ senior unsecured attribution for this issuer was re-affirmed from agency knowledge; pricing on the print reviewed was unchanged
2026-06-30	Pricing refreshed to this factsheet's own valuation date (current version)

Of the three revisions logged above, only the 2026-06-30 pricing is current - the earlier two are retained purely for this factsheet's audit trail and must not be used to price Atkore's notes as of the 2026-06-30 valuation date this corpus otherwise applies.

Distribution restrictions

Internal use only: this factsheet was prepared for this desk's own relative-value analysts and the internal credit committee process referenced elsewhere in this corpus, is never distributed externally, does not qualify as a research

report under any broker-dealer research-independence rule, and is not an offer or solicitation to buy or sell any security; reliance by anyone outside the preparing desk is not appropriate.
This desk uses Atkore and the other four names in this universe purely as relative-value reference points, not as covered issuers under any external research this desk publishes; a reader with access to external coverage of any of these five should regard it as more authoritative than this factsheet on shared topics.
Version identification for this factsheet lives in the Revision history table above; a citation to this factsheet in another memorandum should specify the 2026-06-30 revision, since the table itself marks the earlier revisions' pricing as superseded and unreliable.
This factsheet makes no statement about Kestrel Industries's bond complex, its credit agreement, its senior notes indenture, or the municipal conduit financing discussed elsewhere in this corpus; Atkore is only an independent comparable used for relative-value screening and does not restate any of that separate complex's terms.

Model inputs and assumptions

Input	Value used	Source
Day-count convention (yield approximation)	Actual/365	This desk's own convention
Benchmark curve	2026-06-30 published Treasury par yield curve	Treasury/FRED, retrieved 2026-08-17
Swap curve (I-spread comps only)	Committee-supplied swap curve	Internal, not independently published
Dissemination cap applied	Non-investment-grade ($1,000,000)	FINRA TRACE rulebook
Pricing date	2026-06-30	FINRA TRACE extract for this issuer

These inputs are held constant across all five names in this universe - day-count convention, benchmark curve, and dissemination-cap assumption alike - so any cross-universe spread comparison is consistent on every input except the spread basis, which is addressed separately above.

Frequently referenced terms

The term G-spread denotes, in basis points, the difference between a bond's own yield and the interpolated on-the-run Treasury par curve yield at the same remaining maturity.
By I-spread, this factsheet means the difference, in basis points, between a bond's yield and an interpolated swap-curve yield at that bond's own remaining maturity - a distinct benchmark from G-spread, and not a substitute for it regardless of matching basis-point counts.
By yield to worst, this factsheet means whichever is lower between a bond's yield to maturity and its yield to each scheduled call date, under the assumption that the issuer's call decision is whichever produces the lower holder yield; the Instrument summary table's figure is an approximate convenience number, not an exact calculation.
FINRA's TRACE system caps the trade size it publicly reports for a given security class at the dissemination cap; a trade at or above that cap shows only the cap's own label instead of its actual size, meaning two very differently sized trades can carry an identical disclosed label.

Note on sourcing

As an internal desk work product rather than a public filing, this factsheet follows no single public template - none exists for a comparable-bond relative-value factsheet of this kind. It is assembled from the TRACE print, published Treasury curve, and issuer-rating information cited above, and makes no claim to reproduce any actual desk's internal template.
