Comparable Issuer Factsheet
O-I Glass — relative-value factsheet, prepared as of 2026-06-30
Sector: Glass Container Packaging
O-I Glass produces glass containers for beer, wine, food and non-alcoholic beverage customers across a furnace-based plant network centered on its Ohio operations, selling into replacement-demand-driven categories where consumption is comparatively stable but the producing asset base is capital- and energy-intensive.

Instrument summary

Field	Value
Issuer	O-I Glass
CUSIP	C0400XAA5
Bond symbol	COMPD4A
Coupon	7.375%
Maturity	2032-06-01
Next call date and price	2029-06-01 at 100.000
Current rating	BB
Current price (2026-06-30)	101.755
Yield to worst (approximate convenience figure)	7.017%
Spread (spread to interpolated swap curve (I-spread convention))	290bp
Reported trade-size / liquidity label (2026-06-30 print)	1MM+

Spread basis
Because TRACE reports O-I Glass's spread on a spread to interpolated swap curve (I-spread convention) basis, that is the convention carried through on this factsheet without adjustment. A side-by-side comparison against a comp quoted on the other convention, or against the target's own notes, is only valid once both figures have been put on the same basis; basis-point equality alone does not establish that. The level itself is read against the real BB-band index OAS of 1.64% on 2026-06-30, with O-I Glass's 290bp print representing +126bp of issue-specific desk adjustment to that band.

Benchmark curve context
O-I Glass has roughly 5.93 years to run. Two features of the published 2026-06-30 Treasury curve matter for benchmarking that: it omits the 4-Year tenor, and its short and long ends are genuinely out of order (6-Month above 1-Year; 20-Year above 30-Year). A tenor landing between two published points, including this issuer's own remaining term, must be read off a true linear interpolation between the bracketing points rather than the nearest single point.

Tenor	Par yield (2026-06-30)
1 Mo	3.70%
1.5 Month	3.74%
2 Mo	3.77%
3 Mo	3.87%
4 Mo	3.92%
6 Mo	4.01%
1 Yr	3.98%
2 Yr	4.14%
3 Yr	4.15%
5 Yr	4.19%
7 Yr	4.30%
10 Yr	4.44%
20 Yr	4.93%
30 Yr	4.91%

With 5.93 years remaining, O-I Glass falls between two published tenors on the curve, requiring the linear interpolation 4.19% + ((5.93 - 5) / (7 - 5)) x (4.30% - 4.19%) = 4.2409% rather than a read of the nearer bracketing tenor by itself.
Setting O-I Glass's 7.017% yield to worst against the 4.2409% interpolated benchmark reproduces the 290bp figure stated on the spread to interpolated swap curve (I-spread convention) basis above; a reader who skips the interpolation and reads the nearest tenor instead would compute a materially different, wrong, benchmark.

Comparison to the target's own senior notes
Context, not a comparable: the target's senior notes carry a 7.75% coupon, mature 2031-06-15, carry ratings of B1/B+, and last traded at 98.250 on 2026-06-30, per its own TRACE extract, which states its own spread basis independently of this factsheet. Reading a relative-value signal into any gap between O-I Glass and the target requires first confirming the two spreads are stated on a common basis.

Liquidity
During the 2026-06-26 to 2026-06-30 window, O-I Glass traded across sizes from the odd-lot tier up through the non-investment-grade dissemination cap; a print at that cap is shown at the cap's own label rather than at true size, so the 1MM+ label on the 2026-06-30 print above should be read with that convention in mind.

Key financial metrics (indicative)

Metric (indicative desk estimate)	FY2024	FY2025	LTM
Revenue growth	3.5%	4.1%	4.3%
EBITDA margin	16.4%	16.9%	17.2%
Debt/EBITDA	4.5x	4.4x	4.2x
EBITDA/Interest	2.9x	3.0x	3.1x

Treat the table above as a desk-built estimate for screening, not as O-I Glass's own audited result - this desk has no access to O-I Glass's audited financial statements and these figures should not be cited as such. They are included only to size up leverage and scale against the remaining four names in the comparable universe covered further below.

Credit profile

Its credit profile is that of a capital-intensive container manufacturer whose end-market demand is stable but whose cash flow is dominated by a furnace asset base that must be maintained and rebuilt on multi-year cycles regardless of the demand backdrop; the desk's indicative metrics below should be read with that capital-spending rhythm in mind.

This desk's reading of the issuer's own public filings is that the furnace maintenance and rebuild cadence has been maintained despite leverage considerations, on the view that deferring it costs more than it saves; a reader should confirm that reading against the issuer's current disclosures rather than treat it as a restatement of management guidance.

Structural features

The notes are senior unsecured obligations, subject to a change-of-control repurchase provision requiring an offer to repurchase at a premium to par upon a qualifying change of control; the ratings-qualifier treatment this desk summarizes is shown, at the desk level only, in the covenant package table below.

These structural features do not alter the spread basis this factsheet already stated: O-I Glass's spread to interpolated swap curve (I-spread convention)-basis spread comes straight from its own TRACE extract and is unaffected by the capital-structure ranking these features describe.

Risks to the relative-value view

» An energy-cost spike, given how furnace-intensive glass production is relative to other packaging processes.

» Acceleration of substitution toward aluminum or PET containers in key beverage categories the issuer's glass volumes depend on.

» An unplanned furnace outage at a major plant, which for a furnace-based producer is both a lost-production and a capital-repair event at once.

Historical trading range (indicative, 2026 year to date)

Period	Approximate price range	Approximate yield range
January 2026	98.755 - 99.255	7.617 - 7.747
February-March 2026	99.255 - 100.005	7.527 - 7.617
April-May 2026	100.005 - 101.255	7.147 - 7.527
June 2026 (through 2026-06-30)	101.255 - 101.755	7.017 - 7.147

O-I Glass has not strayed far from a narrow price band this year, consistent with a stable rating and outlook rather than active credit deterioration or improvement. These ranges are indicative desk observations rather than a formal TRACE series, and should not replace the actual TRACE extract for periods earlier than the 2026-06-26 through 2026-06-30 window it covers.

Comparable universe overview

Issuer	Coupon	Maturity	Rating	Spread basis
Wabash National	4.5%	2028-10-15	B+	Treasury
Sensata Technologies	5.875%	2030-09-01	BB+	Treasury
Atkore	4.25%	2031-06-01	BB+	Swap
O-I Glass (this factsheet)	7.375%	2032-06-01	BB	Swap
Dauch Corp	7.75%	2033-10-15	B+	Treasury

The universe table above identifies O-I Glass as Comparable Issuer D, spanning varied coupons, maturities, ratings and spread bases across the five names; this factsheet's own depth is limited to O-I Glass, and a reader wanting the same depth on any other name should consult that name's own factsheet.

Sector overview

The glass container sector sells into food and beverage end markets whose consumption is comparatively stable, but its economics are dominated by furnace capital intensity and energy costs rather than by demand swings. Substitution pressure from aluminum and PET is a permanent feature of the sector, met in part by premiumization and sustainability positioning for glass; a reader comparing this issuer against a less capital-intensive industrial peer should weight that asset-base rigidity accordingly.

Outlook commentary

Looking ahead, we would view the cadence of furnace maintenance and rebuild spending against a stable end-demand base, together with the direction of energy costs, as the key variables to watch for this name's relative-value

trajectory over the next twelve months.
Prepared for internal relative-value screening, the outlook commentary above is this desk's own view, not a credit rating, and it does not stand in for O-I Glass's management guidance beyond the specific attribution to management given under Credit profile above.

Documentation

New York law governs O-I Glass's indenture, consistent with standard US high-yield practice; because this factsheet only summarizes rather than reproduces the indenture's own defined terms, exact covenant or redemption language needs to come from O-I Glass's own indenture, not this document.
The call date and price shown above follow a simplified three-year-ahead-of-maturity par-call convention rather than O-I Glass's own indenture terms; a reader who needs the actual redemption schedule, step-downs included, should go to O-I Glass's indenture directly.

Rating rationale cross-reference

The BB tier shown for O-I Glass is the desk's own rating attribution from agency knowledge rather than a verbatim agency publication; where the two differ, the agency's current published rating governs, and this factsheet's tier should be treated as indicative only.
None of the credit agreement, indenture, or municipal conduit financing covered in this project's rating agency reports on Kestrel Industries involves O-I Glass in any way; O-I Glass is an independent comparable used only for relative-value screening, without ownership, guarantee, or contractual connection.

Additional trading color

O-I Glass's trailing-quarter desk color, beyond the four TRACE prints already tabulated, has been consistent with orderly two-way trading rather than one-sided pressure; no block trade materially above the Historical trading range table's sizes has been observed, and this note is meant to supplement that table, not substitute for it.
Where another source's O-I Glass pricing materially diverges from the TRACE extract cited here, TRACE should be treated as the authoritative record of actual executed trades; verify whether the other source quotes bid, offer, or last-trade before treating the divergence as real.

Covenant package summary (indicative)

Covenant	Type	Comment
Limitation on Indebtedness	First lien / unsecured split test	A BB attributed issuer's indenture typically separates secured from unsecured capacity, and this package is shown that way: first lien net leverage may not exceed 3.50x while total net leverage may not exceed 5.50x.
Limitation on Restricted Payments	Builder basket with a first-lien condition	Restricted payments are permitted from a builder basket only absent a default and only while pro forma first lien net leverage is below 3.50x, keyed to the same secured/unsecured split as the debt covenant.
Limitation on Liens	Permitted liens with secured-debt parity	Lien baskets are sized to preserve parity between secured and unsecured creditors, with an equal-and-ratable lien requirement on any secured debt incurrence - the wording that follows from the split test above.
Change of Control	Repurchase offer upon a qualifying event	The notes are callable, and the change-of-control repurchase offer applies on a qualifying event without a ratings-decline qualifier in this desk's summary.
Reporting covenant	Periodic reporting to trustee and holders	Standard incurrence-based reporting covenant, with first-lien-test compliance confirmed in the annual officer certificate.

The table above reflects this desk's summary view of O-I Glass's package structure, not a reproduction of the indenture's operative text; anyone needing precise language, basket sizes, or carve-outs for O-I Glass should go to the indenture and the issuer's filed debt disclosures instead of this summary.

Frequently asked questions

This factsheet uses a spread to interpolated swap curve (I-spread convention) basis for O-I Glass simply because that is what the underlying TRACE extract reports; the desk's practice is to leave each name on its own extract's basis rather than force a single universe-wide convention, which keeps every figure independently verifiable.
O-I Glass does not officially report the yield to worst shown here; this desk approximated it from reported price, coupon, and remaining term as a convenience figure, paralleling how FINRA's YLD_PT field is itself derived rather than the contractually controlling price quantity.
O-I Glass and the target company this corpus otherwise concerns have no relationship; see Rating rationale cross-reference above for that disclosure.

Recovery considerations

In ranking, O-I Glass's notes are senior unsecured - they would fall behind secured indebtedness at default and rank pari passu with other unsecured debt. No independent recovery estimate is published by this desk for this name; the relevant rating agency's own published issue-level action for O-I Glass, if any exists, is the source for a formal Recovery Rating rather than this factsheet, which addresses relative value only and not recovery in a default scenario.

Recovery for a senior unsecured issue of this profile, from an issuer of comparable size and sector, would generally be expected to span a wide range in a going-concern default, driven by the amount of secured debt ahead of it; this desk does not hold the balance-sheet detail on this comparable needed to narrow that range further.

Capital structure and ranking detail (indicative)

The glass container producer's capital structure is dominated by its furnace asset base: beneath the senior unsecured notes sits a working-capital facility, but the balance-sheet item a reader should weight most heavily is the scheduled rebuild cadence of the furnaces themselves, which arrives on multi-year cycles regardless of the demand backdrop.

Because furnace rebuilds are capital events rather than expenses, a stress scenario for an issuer of this kind pairs operating pressure with a capital commitment that cannot be deferred indefinitely; unsecured recovery analysis therefore treats the furnace network's condition as a first-order variable rather than a footnote.

Energy contracts and cullet (recycled glass) sourcing arrangements sit alongside the debt structure as fixed-charge-adjacent commitments; this desk has not modeled the issuer's specific contract portfolio, and a reader requiring that detail should go to the issuer's own disclosures.

Extended relative-value screen against the peer set

Of the five names in this universe, this issuer's end-market demand is arguably the most stable - food and beverage consumption does not swing with freight rates, construction starts or vehicle production - but its asset base is the most capital-committed, a structural contrast with every other name here that a reader comparing indicative leverage across the universe should keep in view.

This desk includes this issuer partly as the universe's capital-intensity contrast: pairing it against the trailer name, the other heavy-asset manufacturer here, isolates what end-demand stability is and is not worth to a spread when the asset base is furnace-committed either way.

Among the five sector labels in this universe, Glass Container Packaging is, in this desk's own categorization, the one whose margin structure is most exposed to an energy and capital-replacement cost cycle rather than to a demand cycle, a distinction that a reader attributing spread moves across the universe to a common macro driver should not overlook.

Additional desk observations (sector-specific)

Energy-cost pass-through for a furnace-based producer of this kind has, in this desk's informal observation, generally lagged spot energy movements by one to two quarters, a pattern that would tend to compress margin during a period of above-trend energy inflation even absent any issuer-specific operating shortfall.

This desk has not identified a public announcement of a material furnace outage or unplanned rebuild for this specific issuer as of the 2026-06-30 valuation date; the furnace-capital risk discussed under Risks to the relative-value view above remains this desk's principal near-term monitoring point for this name.

This desk would also flag, as a general sector observation rather than an issuer-specific finding, that glass container demand in food and beverage categories has historically proven less sensitive to a consumer-spending downturn than discretionary packaging categories, since the end products are staples rather than deferrable purchases.

This desk would also note that premiumization and recycled-content positioning have been the sector's principal responses to aluminum and PET substitution pressure, so a mix shift toward premium glass lines, even at flat tonnage, would generally be a credit-supportive development for an issuer of this profile; this desk has not identified a specific premium-mix disclosure of that kind for this issuer.

Furnace rebuild cadence for a producer of this kind is typically a scheduled multi-year program rather than a discretionary annual budget line, and deferring a rebuild generally raises operating risk rather than saving cost; this desk is not aware of any publicly disclosed deviation from the issuer's own rebuild schedule as of the 2026-06-30 valuation date.

Cullet (recycled glass) sourcing and energy contract structures sit alongside the debt stack as cost commitments that move with markets the issuer does not control; this desk has not modeled the issuer's specific contract portfolio, and a reader assessing structural liquidity for a name of this kind should weight those commitments accordingly.

The reader should also bear in mind that the indicative metrics table above does not disaggregate the issuer's capacity utilization in any of the three periods it presents, nor the share of revenue from any single plant region, and this desk regards that omission as immaterial to the relative-value conclusions drawn elsewhere in this factsheet; a reader requiring that breakdown should consult the issuer's own disclosures rather than infer it from this table.

Desk contacts

Natasha Meyers — Relative Value, Leveraged Finance Trading Desk

Antonio Villarreal — Relative Value, Leveraged Finance Trading Desk

The desk contacts above, not the rating agencies named elsewhere in this corpus, are the right point of contact for a question about this factsheet or a request for an updated print - those agencies played no role in preparing this internal desk work product.

Revision history

Date	Change
2026-04-21	Initial factsheet prepared
2026-06-05	Spread-band review: this issuer's level was re-checked against the BB-band index anchor on the latest print date; no repositioning recommended

2026-06-30	Pricing refreshed to this factsheet's own valuation date (current version)

This factsheet's audit trail is the only reason the two earlier revisions above are retained; current pricing for O-I Glass's notes, as of the 2026-06-30 valuation date this corpus otherwise uses, is limited to the 2026-06-30 print in the Instrument summary table.

Distribution restrictions

This document is solely for the internal relative-value analysts of this desk and the internal credit committee process referenced elsewhere in this corpus; it is never distributed externally, does not amount to a research report under any applicable broker-dealer research-independence rule, and is not an offer or solicitation to buy or sell any security - reliance outside the preparing desk is not intended.

As reference points only, O-I Glass and the other four names here are not covered issuers of this desk's external published research, to the extent it exists; external research covering any of the five, where available, should be treated as more authoritative than this factsheet on the same topics.

Look to the Revision history table above to identify this factsheet's version; when citing a figure from it elsewhere, cite the 2026-06-30 revision specifically, since that same table marks the earlier revisions as superseded and not to be relied on.

None of this factsheet's content bears on Kestrel Industries's own bond complex, credit agreement, senior notes indenture, or the municipal conduit financing discussed elsewhere in this corpus; O-I Glass is an unrelated, independent comparable used solely for relative-value screening against that separate complex.

Model inputs and assumptions

Input	Value used	Source
Day-count convention (yield approximation)	Actual/365	This desk's own convention
Benchmark curve	2026-06-30 published Treasury par yield curve	Treasury/FRED, retrieved 2026-08-17
Swap curve (I-spread comps only)	Committee-supplied swap curve	Internal, not independently published
Dissemination cap applied	Non-investment-grade ($1,000,000)	FINRA TRACE rulebook
Pricing date	2026-06-30	FINRA TRACE extract for this issuer

Across the five factsheets in this universe, the inputs above never change - the day-count convention, benchmark curve, and dissemination-cap assumption are identical name to name - leaving the spread basis, addressed above, as the only input a cross-universe comparison needs to check.

Frequently referenced terms

G-spread is a basis-point measure of how far a bond's yield sits above (or below) an interpolated point on the on-the-run Treasury par yield curve, taken at that bond's own remaining maturity.

The term I-spread denotes a bond's yield gap, in basis points, against an interpolated point on the swap curve at the bond's own remaining maturity; because the benchmark curve differs from G-spread's, the two figures are not interchangeable even when numerically equal.

Yield to worst takes the lower of a bond's yield to maturity and its yield to every scheduled call date, assuming the issuer behaves however that produces the lower yield to the holder; the number in this factsheet's Instrument summary table is an approximate convenience figure rather than a precise yield-to-worst calculation.

By dissemination cap, this factsheet means the ceiling FINRA's TRACE system places on the trade size it discloses for a security class; prints at or beyond that ceiling appear only at the cap's label, not their true size, so identical disclosed labels can hide very different actual trade sizes.

Note on sourcing

This is an internal desk work product, not a public filing, and no regulator or public template governs a comparable-bond relative-value factsheet of this type; its content comes from the same TRACE print, published Treasury curve, and issuer-rating information cited above, with no claim to replicate a specific real desk's own template.
